ENVIRONMENTAL ASSESSMENT BOARD
ONTARIO HYDRO DEMAND/SUPPLY PLAN HEARING

IN THE MATTER OF the Environmental Assessment Act,
R.S.O. 1980, c. 140, as amended, and Regulations
thereunder;

AND IN THE MATTER OF an undertaking by Ontario Hydro
consisting of a program in respect of activities
associated with meeting future electricity
requirements in Ontario.

Held on the 5th Floor, 2200
Yonge Street, Toronto, Ontario,
Thursday, the 28th day of May,
1992, commencing at 10:00 a.m.

9 FREDERICK GEORGE LONG,
10 BRIAN PAUL WILLIAM DALZIEL,
11 HELEN ANNE HOWES; Resumed.

12 CROSS-EXAMINATION BY MR. GREENSPOON (Cont'd):

13 Q. Mr. Dalziel, we ended yesterday at
14 the point where we were talking about the plans that
15 Hydro has formulated, the illustrative plans, and the
16 one particular plan that was closest to what I could
17 call a no-growth scenario, perhaps, where I put to you
18 that there would be no supply, and the closest plan
19 that Ontario Hydro has to no supply is found on page
20 D2-1, that's the 1992 DSP Update, lower load growth
21 case, LVH1AROP.

22 MR. DALZIEL: A. That's the one with no
23 new major supply. It does have the supply associated
24 with the hydraulic option and it does include the
25 Manitoba Purchase.

26 Q. But the supply associated the
27 hydraulic option is deferred until the end of the

1 planning period. If you look at the --

2 A. That's correct, they are.

3 Q. Hydraulic developments that are
4 referred towards the end of the planning period. So
5 that is around 2014, or thereabouts?

6 A. Between the period 2007 to 2014.

7 Q. All right. And I don't see any
8 mention of Little Jackfish in that plan. I notice that
9 on page 22 of the Update we see that one of the ways of
10 managing the surplus to have been cancelling Little
11 Jackfish.

12 Do you know what Little Jackfish's status
13 is, Mr. Snelson, on D2-1, Mr. Dalziel?

14 A. There are two projects that are not
15 included as part of the hydraulic option in this case,
16 one is Little Jackfish, the other is Ragged Chute is
17 not included either.

18 Q. Where do I find that? I don't see
19 that on D2-1. Do I have to look at the charts to see
20 that?

21 A. Yes, you would have to look at the
22 chart on page D2-3.

23 Q. And where does that tell me that
24 Little Jackfish is cancelled?

25 A. If you look down the left-hand side

1 of the page, the descriptions, you will find a column
2 called Uncommitted Hydraulic.

3 Q. Yes?

4 A. And if we run across that line and if
5 we were familiar with the capacity characteristics
6 associated with the Little Jackfish site and Ragged
7 Chute there is no capacity of 132 megawatts and 98
8 megawatts.

9 Q. That's a tricky way to have to find
10 it, but I take your word for it.

11 Now, if we look at getting back to
12 environmental impacts of the plans, if we look at D2-9,
13 certainly prior to the year 2008, or inclusive of the
14 year 2008, this appears to me to be the only plan that
15 reduces SO(2), NOx and CO(2), would you agree with
16 that?

17 MS. HOWES: A. I would say that those
18 emissions are lowest.

19 If you just look at figure C-3, though,
20 if you look beyond the period, there may be some issue
21 with respect to CO(2), but generally these are lower
22 emissions.

23 Q. Yes, I said inclusive of 2008.

24 A. 8, yes.

25 Q. And just one last point on this. If

1 you turn to page 7 of the Update, Exhibit 452, this is
2 the forecast that we are talking about, that is the
3 line starting around the 23, 24 gigawatt and then
4 reducing to almost 20 by the year 2006. Is that the
5 forecast that this plan is designed to meet?

6 MR. DALZIEL: A. That's correct.

7 Q. And just going back to what we talked
8 about yesterday, that forecast would be the most in
9 keeping with the Exhibit 688 that I filed, that is
10 Beyond the Limits. Would you agree with that, Ms.
11 Howes?

12 That is a forecast that saw no growth in
13 the society?

14 MS. HOWES: A. I am not sure that I can
15 draw that conclusion from the few pages of the document
16 I saw.

17 Q. Let's take the predecessor to that
18 document then that you said you had read, the Limits to
19 Growth?

20 A. Limits to Growth.

21 I would agree that this particular plan
22 is the lowest of the ones that we looked at. I'm not
23 sure that based on my recollection of the document I
24 probably read in 1972, that I could draw that
25 conclusion.

1 Q. Okay. I don't think anything turns
2 on that.

3 Just one last thing on this. If you look
4 to D2-6.

5 THE CHAIRMAN: Back at 686?

6 MR. GREENSPOON: Yes, that's correct.

7 Q. We are still talking the no-growth
8 plan, if I could call it that, with the exception of
9 Manitoba. The Manitoba Purchase doesn't come into play
10 until around 1999 and never really plays a big part in
11 supply, does it, Mr. Dalziel? Relatively speaking,
12 it's a pretty minor part of the energy future for
13 Ontario.

14 MR. DALZIEL: A. Compared to the energy
15 associated with the existing system, it is a small
16 component, but perhaps compared to the amounts of
17 energy required above an existing level of demand, in
18 this case it would represent a significant
19 contribution.

20 Q. Well, for example, demand reducing
21 options, purchase NUGs, are as big and later bigger
22 than the Manitoba Purchase?

23 A. That's correct.

24 Q. So that managing the surplus that we
25 read about on page 22 of the Update, when Hydro says if

1 the surplus were to materialize there would be adverse
2 rate impacts for customers as a result of paying for
3 the costs of non-utility generation and demand
4 management that is not required, we could just as
5 easily say if the surplus were to materialize there
6 would be adverse rate impacts for customers as a result
7 of paying for the costs of the Manitoba Purchase.

8 DR. LONG: A. Could you repeat that
9 question?

10 Q. Well, maybe you should turn to page
11 22 of the Update because I am just reading directly
12 from it.

13 A. I have that.

14 Q. You see the big paragraph in the
15 middle of the page?

16 A. Yes.

17 Q. And the second sentence, if the
18 surplus were to materialize, now I read that sentence
19 and then I said, it could just as easily be said or
20 read that if the surplus were to materialize there
21 would be adverse impacts for customers as a result of
22 paying for the costs of the Manitoba Purchase.

23 A. I guess to the extent that a contract
24 exists, I'm not sure that the same conclusion can be
25 drawn in this case.

1 Q. And is that because of the penalty
2 clause? Is that what you mean by that fact that a
3 contract exists?

4 [10:15 a.m.]

5 A. I'm not that familiar with all the
6 details of the contract, but my understanding is that
7 it is not entirely within our powers to just cancel the
8 contract. My belief is that it is tied to gaining the
9 necessary environmental approvals.

10 Q. All right. Well, let's just look at
11 it from an environmental assessment point of view, and
12 that is what we are here for, is to weigh the options
13 one against the other.

14 Leaving aside the fact that there is a
15 contract, whatever material difference that may make,
16 and I'm sure that this will be argued more fully at
17 later date, but you would agree with me that when you
18 are managing a surplus the Manitoba Purchase is as much
19 a part of the surplus in the future as NUGs or DSM, and
20 it is a matter of which ones we choose?

21 A. I would agree that we have some
22 choices in the manner in which we can manage the
23 surplus, yes.

24 Q. All right. And if we go to Exhibit
25 3, just before page 7-11, Mr. Snelson, I am not the

1 sure whether Dr. Long or you would answer this, but
2 when we look at evaluating the Manitoba Purchase we
3 have got to count two costs. We have got to count the
4 cost of power and the cost of the transmission?

5 MR. SNELSON: A. Yes.

6 Q. That is the cost to the customer, to
7 Ontario Hydro?

8 A. Yes, in very simple terms.

9 Q. And when you look at page 7-11,
10 figure 7-5, where electricity is used in Ontario, you
11 see that only 5 per cent of the electricity is used in
12 the northwest and 8 per cent in the northeast, and I
13 put to you that even that is somewhat misleading
14 because, at least where that circle is found, it is
15 common knowledge that most of the electricity that is
16 used in the northeast is used at the southern end of
17 the northeast; that is, the corridor from Sault Ste.
18 Marie to North Bay?

19 You have Inco, Falconbridge, E.B. Eddy,
20 Algoma Steel, all the lumber companies on the Ottawa
21 River, that is where most of the electricity is used in
22 Northeastern Ontario?

23 A. I believe that is probably true. I
24 haven't analyzed it, but the larger centres such as
25 Sudbury, North Bay, and Sault Ste. Marie may not --

1 yes, Sault Ste. Marie would be counted if this is all
2 of Ontario, yes.

3 Q. Yes. Even though it is a different
4 utility.

5 A. That's correct.

6 Q. And the circle we see there for
7 Hydro's regionalization of the province, it probably
8 puts it in the middle geographically, but it appears to
9 me that is somewhere north of Timmins or Cochrane?

10 A. I don't think there was any
11 significance intended from the placement of the circle,
12 other than to identify Ontario Hydro's northeast
13 region.

14 Q. All right. Let's just say for
15 convenience sake that if you drew that line across
16 Georgian Bay -- you see the Georgian Bay line there, 7
17 per cent, Georgian Bay, on the left of figure 7-5?

18 A. Yes.

19 Q. The line that points to the -- and
20 then goes down south?

21 A. Yes.

22 Q. If you drew that line across and I
23 will put a figure to you and you can tell me if it is
24 reasonable. From there north you probably have 6 per
25 cent at the most?

1 A. You are including the 5 per cent
2 for --

3 Q. I am including the 5 per cent and I
4 am adding about 1 per cent, because that line puts you
5 north of the Sault, it puts you north of Sudbury, and
6 it almost puts you north of Timmins.

7 A. I couldn't comment other than the
8 discussion we have already had that some of the major
9 populations and industrial centres are south of that.

10 Q. Certainly, substantially it can't be
11 any greater than 13 per cent, obviously.

12 A. Yes.

13 Q. And it is probably towards the lower
14 end of that 8 per cent plus the 5 per cent.

15 A. Given the distribution of population
16 and industry that is probably the case.

17 Q. So then we are going to look at with
18 Ontario Hydro's Manitoba Purchase a 9,000 hectare swath
19 from that line to the Manitoba border for transmission?
20 9,000 hectares, Dr. Tennyson?

21 DR. TENNYSON: A. That is about right.
22 On Panel 7 I think it was 8,800.

23 Q. And how in planning has that been
24 weighed against the cost of the Manitoba Purchase,
25 against the benefits of the electricity coming into

1 Ontario?

2 THE CHAIRMAN: You will remember that
3 this was all discussed quite extensively in Panel 7.

4 MR. GREENSPOON: Well, I don't want to
5 talk about environmental impacts, Mr. Chairman. My
6 understanding about the purpose of --

7 THE CHAIRMAN: No, no. All the reasons
8 that you are talking about now were all explored in
9 Panel 7.

10 What is your question to this panel?
11 That is what I am trying to get at.

12 MR. GREENSPOON: Well, I thought we were
13 here in this panel to determine how Hydro --

14 THE CHAIRMAN: Yes, okay. Ask them a
15 question. That is what I am trying to get at.

16 MR. GREENSPOON: Q. Well, the question
17 is: How in planning do you make the decision to choose
18 the Manitoba Purchase over non-utility generation or
19 demand management or other options, weighing the impact
20 on 9,000 hectares of northeastern and northwestern
21 Ontario?

22 MR. SNELSON: A. The area of the
23 transmission line is one of the factors that is
24 identified as one of the characteristics of that
25 option. I believe it is in the Options Comparison

1 tables which are part of the witness statement.

2 Q. The supplementary witness statement?

3 A. Yes. Exhibit 646.

4 Q. Well, maybe I will be more specific.

5 What are the benefits to Northeastern and Northwestern
6 Ontario of the Manitoba Purchase?

7 A. I think we have indicated that the
8 transmission, the strengthening of the transmission
9 system through Northern Ontario is of significant
10 benefit in terms of better integration of the
11 electricity system in Ontario. It provides a long-term
12 benefit in terms of the integration of Northwestern
13 Ontario in particular into the rest of the system to
14 provide for better scheduling of generation, which
15 tends to reduce system cost.

16 It may also have benefits in terms of
17 better planning of the system in Northern Ontario in
18 that with a stronger transmission system then there is
19 a wider choice of options for planning in the North.

20 There is the ability to accommodate
21 changes in load either up or down in the North as a
22 result of whatever circumstances that might arise.

23 Q. But I don't understand that. If a
24 system uses 5 per cent of the provincial electricity
25 and already has electricity flowing south, for example

1 from Atikokan, how can it be an advantage to make that
2 system bigger?

3 A. I think that we have indicated that
4 Northern Ontario in general over much of the last 20 or
5 30 years has been a net importer of electricity.

6 Q. All right. You agreed with me that,
7 I think - or if you didn't, Ontario Hydro has certainly
8 agreed - that there is a lot of cogeneration potential
9 in Northeastern and Northwestern Ontario. That is
10 where most of it is?

11 A. There is a lot of cogeneration
12 potential --

13 Q. And we talked yesterday about a
14 possibility of about 1,000 megawatts in the pulp and
15 paper industry alone, and you didn't disagree with that
16 number?

17 A. I didn't disagree with that number.
18 I didn't agree with it either. I just said it is a
19 large number.

20 Q. And there is a line running from
21 Manitoba to Toronto right now, isn't there?

22 A. There is a transmission system that
23 runs from the Manitoba border, including the
24 transmission in Northwestern Ontario, Northeastern
25 Ontario and to Toronto.

1 Q. And wouldn't it make more sense in
2 terms of cost to the province and in terms of impacts
3 on the environment to maximize cogeneration and
4 non-utility generation along that line rather than
5 moving electricity all the way from Manitoba to
6 Toronto?

7 A. I think you have to weigh all of the
8 costs and benefits of those options. We have discussed
9 the benefit of the transmission line, and it does
10 provide flexibility in some respects which cogeneration
11 would not.

12 Q. Certainly, if you had a philosophy of
13 local indigenous supply it wouldn't encompass this kind
14 of a purchase, this kind of a transmission corridor?

15 A. Are you categorizing cogeneration as
16 local indigenous supply?

17 Q. Any kind of non-utility generation.
18 [10:30 a.m.]

19 A. Well, non-utility generation is just
20 a definition of who owns it, it's not a question of
21 where the resources come from.

22 Q. Let's limit the definition then to
23 renewable non-utility generation and cogeneration.

24 A. Cogeneration largely relies upon
25 natural gas, which is an imported resource into the

1 province.

2 Q. Yes, but it's natural gas that's
3 being used industrially anyway and all cogeneration
4 does is make the use of that more efficient by
5 producing electricity?

6 A. No.

7 Q. Why do you say no?

8 A. Because to cogenerate you require
9 additional supplies of natural gas.

10 Q. But you are using the gas that you
11 were already using more efficiently.

12 A. No.

13 Q. You are not?

14 A. No.

15 Q. Well, that certainly wasn't the
16 evidence that we heard from Panel 5.

17 A. You are using natural gas to produce
18 electricity much more efficiency than if you used
19 natural gas to produce electricity in an
20 electricity-only natural gas facility. But to produce
21 electricity by cogeneration from a place that currently
22 uses natural gas to raise steam, then the use of
23 natural gas to raise steam can be quite efficient
24 already.

25 The additional natural gas that you need

1 to generate electricity is less than the initial
2 natural gas you would need to generate the same amount
3 of electricity in a non-cogenerating plant.

4 Q. I will leave that for now.

5 Why is it that Ontario Hydro is
6 proceeding with concurrent environmental assessments
7 with respect to the Manitoba Purchase?

8 A. I think there are at least two
9 reasons. One is that that is the most expeditious way
10 and probably the only way in which we can have the
11 transmission schedule such that we can have the
12 transmission in time to acquire the purchase, and the
13 second reason is that the provincial government in its
14 new energy directions instructed Ontario Hydro to move
15 forward expeditiously with the environmental assessment
16 of the Manitoba Purchase transmission.

17 Q. And in fact, Ontario Hydro has
18 already commenced environmental assessment processes
19 for a line from the greater Toronto area to Hanmer,
20 which is just north of Sudbury, and as well from Hanmer
21 to Hunta, which is around Timmins; is that right?

22 A. Yes.

23 Q. And is this not another example of
24 prejudging a decision from this Panel, such as the
25 penalty clause in the contract with Manitoba?

1 A. No.

2 Q. You don't feel you are painting this
3 Board into a corner with respect to making its
4 decision?

5 MR. B. CAMPBELL: Mr. Chairman, we have
6 been around this several times, it's come up
7 throughout. I don't think this is an appropriate
8 question to put to a witness.

9 If Mr. Greenspoon has some arguments he
10 wants to make on this matter, at an appropriate time I
11 would be pleased to deal with them in that context.
12 But I do believe, in my submission, this is an
13 appropriate cross-examination.

14 THE CHAIRMAN: He has already asked the
15 question, the answer is no.

16 MR. B. CAMPBELL: It was the next
17 question.

18 MR. GREENSPOON: Q. Isn't it true that
19 Ontario Hydro sees Northern Ontario as a resource sink
20 for electricity for the south?

21 MR. SNELSON: A. No.

22 Q. Why do we need a big swath from
23 Hanmer to Ontario? What is the purpose of it?

24 THE CHAIRMAN: Mr. Greenspoon, we went
25 through all this in Panel 7. You have asked that

1 question before and I think they have answered it the
2 best they can. The question is argumentative,
3 furthermore.

4 MR. GREENSPOON: Q. What about the
5 reliability of Manitoba, Mr. Snelson, have the hearings
6 started as of today, do you know?

7 THE CHAIRMAN: Perhaps you could ask him
8 if there is anything additional that they know about
9 the process in Manitoba that they didn't know when
10 Panel 7 was on. Perhaps I will ask that question.

11 MR. SNELSON: The answer to that question
12 is that I don't know of anything additional.

13 THE CHAIRMAN: All right.

14 MR. GREENSPOON: Q. What is the planning
15 process if the Manitoba Purchase from that end is not
16 approved environmentally in the Province of Manitoba,
17 if they don't get an environmental approval either
18 because of a federal process or a provincial process?

19 MR. SNELSON: A. I'm not sure as
20 precisely how that is defined in terms of the contract.
21 The contract specifies certain penalty clauses if
22 Ontario Hydro fails to get it's approvals, I believe
23 there is some corresponding provision if they fail to
24 get their approvals, but I am not as familiar as Mr.
25 Huggins was with the details of those contract

1 provisions.

2 Q. All right. But again, Ontario Hydro
3 doesn't have a plan that anticipates no Manitoba
4 Purchase and no growth, although you do have a scenario
5 as we heard in direct evidence for managing not getting
6 the Manitoba Purchase.

7 A. As we have indicated, there are
8 uncertainties associated with all the options that we
9 are pursuing and that's part of the management of the
10 system and its plans. And we do look at scenarios that
11 say, as you have seen, what happens with lower growth,
12 what happens with higher growth. And as I indicated in
13 my direct evidence, those scenarios also cover off what
14 happens if the need for resources is higher because
15 some other resource doesn't come along as planned.

16 Q. Now, in terms of managing the
17 surplus, has there been any planning with respect to
18 retubing? Has there been any contingency?

19 I notice that in all of the plans there
20 seems to be a balancing between mothballing and
21 bringing back fossil. I see no mention about
22 contingencies for retubing the nuclear plants. Has
23 there been any planning decisions made with respect to
24 that?

25 A. The planning assumes a schedule for

1 retubing plants, retubing nuclear plants, which is
2 based on the physical expectation of when those plants
3 need to be retubed, and I believe Panel 9 have probably
4 discussed that at some extent length--

5 Q. Yes. I was just wondering from a
6 planning point of view?

7 A. --and that schedule at times is
8 modified from a planning point of view because of
9 planning considerations by advancing dates by a few
10 years if that's better from a planning point of view.

11 Q. But in terms of mothballing, there is
12 no analogous way of dealing with a nuclear plant. You
13 either retube it or you shut it down. From a planning
14 perspective you don't have the flexibility, whereas in
15 all the plans we can look at, you are going to mothball
16 Lakeview, you are going to bring it back on later on.
17 You have a lot of movement in your plans, in all of the
18 ten or so scenarios that you put forward in your
19 supplementary witness statement, but nowhere we do we
20 see a revision in the schedule of retubing?

21 A. I think retubing and mothballing are
22 quite separate things.

23 Q. Of course they are. But just from a
24 flexibility point of view, we don't see anywhere in any
25 of your plans Bruce will not be retubed?

1 A. I don't believe that we have that
2 scenario in, though in the decisions to rehabilitate
3 Bruce, then consideration was given to what happens,
4 what would happen if you didn't rehabilitate them, then
5 retired the plant.

6 Q. Yes, we heard that evidence in Panel
7 9.

8 And the same thing with respect to
9 managing the surplus when you come to the three units
10 at Darlington that haven't yet been fired up, there is
11 nowhere in any of your scenarios where those units
12 don't get fired up?

13 A. I don't believe there is. I don't
14 believe there is.

15 Q. And all of those ways from a planning
16 perspective are ways that the surplus could be managed,
17 Bruce not being retubed, Darlington not being fired up?

18 A. Those would be ways of managing
19 surplus, they wouldn't necessarily be the best ways of
20 managing the surplus.

21 Q. And you have looked at those, have
22 you?

23 A. In a judgmental way in deciding what
24 to look at, then you select those options that you
25 think are most likely to be beneficial as being ones

1 that you look at. And so, those are considerations
2 that would be taken into account judgmentally.

3 Q. Now, Mr. Shalaby, I wanted to talk
4 for a minute on DSM.

5 I recall having a discussion not on the
6 record with Mr. Burke about energy efficient light
7 bulbs, and when I told him that I changed all my light
8 bulbs in my house to energy efficient light bulbs, he
9 told me that probably only two or three of them were
10 economic, the ones that I used a lot. But would it be
11 fair to say the more the rates go up, and the rates are
12 going up, the more the rates go up the more economic
13 those energy efficient light bulbs become; isn't that
14 true?

15 MR. SHALABY: A. The more they save you
16 money. The sense of economic as you recall that we use
17 is the total customer cost, which is somewhat
18 independent of rates.

19 Q. But if Ontario Hydro's mandate is to
20 deliver inexpensive electricity, from my point of view
21 as a customer, the best way to do that is to reduce my
22 Hydro bill.

23 A. I accept that.

24 Q. And the higher the rates go, the more
25 economic sense a light bulb, an energy efficient light

1 bulb makes to me as a customer?

2 A. I agree with that.

3 Q. And if we look at a couple of
4 utilities in the United States, Southern California
5 Edison and Pacific Gas and Electric, are you aware that
6 both of those utilities have planned to meet their
7 supply, their demand for the next 10 years or more from
8 efficiency and renewables, two-thirds efficiency in the
9 case of the South California Edison and three quarters
10 efficiency in the case of Pacific Gas and Electric?

11 A. Those number do not surprise me.

12 Q. And Pacific Gas and Electric is I
13 think about a 20 gigawatt utility, peak?

14 A. That's about right.

15 Q. Very similar to Ontario Hydro?

16 A. I thought it was smaller than Ontario
17 Hydro. I thought it was about 12 or 13 gigawatt peak.

18 Q. The number I got last night talking
19 to Amory Lovins was 20 gigawatts. I have no other
20 information.

21 If it is 20 gigawatts, it's around the
22 same size of Ontario Hydro?

23 A. If it is. It's likely smaller. If
24 it is closer to my recollection, it's about half.

25 Q. It's a large utility.

1 A. That much I can agree with you. It's
2 the largest industrial utility in the United States.

3 Q. And from a planning perspective,
4 meeting three quarters of the their demand with
5 conservation and efficiency is certainly a different
6 plan than you have at Ontario Hydro.

7 A. I wouldn't agree with that.

8 q. You wouldn't agree?

9 A. No.

10 Q. Does Ontario Hydro plan to meet three
11 quarters of its future demand with conservation and
12 efficiency?

13 A. If you look in the 1990s, I don't
14 think we are far off that, yes.

15 Q. All right. When we look at the
16 charts of the three supply scenarios, starting with
17 page 29 --

18 A. I see the Board members perhaps
19 trying to find something to support the percentage of
20 the demand management to meet the demand in the 90s, so
21 perhaps we can try to spend a minute to try and find
22 some graphs that will give us some indication of that.
23 [10:41 a.m.]

24 Q. What are you looking at, Mr. Shalaby?

25 A. I am trying to find a graph that

1 would give us sense of how much demand management is
2 meeting increase in demand.

3 THE CHAIRMAN: Look at 119 of your
4 overhead.

5 MR. B. CAMPBELL: All right.

6 MR. SHALABY: This helping each other
7 goes both ways here. That's very nice. Yes, 119 is an
8 excellent choice, Mr. Chairman.

9 MR. GREENSPOON: Q. If we look at page
10 29 of this same document that is the -- at least, in my
11 copy you can overlay page 29 over page 30 and 31 and
12 32, which are the three plans, and you can see that
13 those follow the same pattern; is that fair to say?

14 MR. SHALABY: A. They follow the same
15 pattern. The scale is not exactly the same.

16 Q. Not exactly the same.

17 A. You can't really see through it.

18 Q. No. Right. We talked a little bit
19 about the impact of the tailings yesterday and Ontario
20 Hydro's, I think you agreed with me, Ms. Howes, that
21 certainly it was an indirect impact of generating
22 nuclear electricity?

23 MS. HOWES: A. Yes, but we also agreed
24 that it was a highly regulated industry and there were
25 other players.

1 Q. Well, I didn't agree with that, but
2 you said that.

3 A. Oh, okay. Yes, indeed, I did say
4 that.

5 Q. And there will be more tailings
6 generated by the time 2009-and-a-half comes along if we
7 look at page 30, both in Elliot Lake and Saskatchewan,
8 I take it, if Ontario Hydro continues to operate
9 Darlington, Bruce and Pickering?

10 A. Indeed, if more uranium was required
11 there would be some more tailings. I guess it is not
12 clear to me where we are purchasing the uranium from.
13 There would be some purchase from Elliot Lake I think
14 in the '90s. I'm not sure beyond that point.

15 Q. Well, it is an impact somewhere
16 certainly?

17 A. I will give you that.

18 Q. And in terms of the past it certainly
19 may not be a topic directly connected to this hearing,
20 but does Ontario Hydro have any plans to do any
21 rehabilitation in Elliot Lake?

22 THE CHAIRMAN: Well, now, again this was
23 a matter which was discussed and answered, I thought,
24 by the Panel 9 witnesses.

25 MS. HOWES: That's correct. It was.

1 MR. GREENSPOON: Q. Well, just to
2 confirm, you don't have any plans to do rehabilitation
3 in Elliot Lake?

4 THE CHAIRMAN: I think if I recall - and
5 I don't always trust my memory - that they have no
6 physical plans, but that they may make a monetary
7 contribution. I think that was what --

8 MR. B. CAMPBELL: I think they are
9 contractual requirements to meet the regulatory
10 requirements. There was discussion of the Stanleigh
11 Mine in particular.

12 MS. HOWES: That's right.

13 MR. B. CAMPBELL: I think if the question
14 is as simple as will Ontario Hydro personnel themselves
15 be doing the work, that is not I think the nature of
16 the obligation, but there are contractual obligations
17 as a result of the contracts with Hydro to do
18 rehabilitation work, as I understand the evidence.

19 MR. GREENSPOON: Q. All right. Assuming
20 that the contracts end in '94 and Ontario Hydro doesn't
21 buy any more uranium from Elliot Lake, then in 2009.5
22 when we start...I guess that is a CANDU 6 on page 30,
23 will Ontario Hydro have any regard to the situation in
24 Elliot Lake when it determines whether or not they are
25 going to start up that nuclear reactor?

1 In other words, would Ontario Hydro be
2 willing to agree not to start up any more nuclear
3 reactors in Ontario unless the tailings had been
4 rehabilitated or commenced to be rehabilitated in
5 Elliot Lake?

6 MS. HOWES: A. I'm not sure I am able to
7 answer that question.

8 Q. And from a planning point of view,
9 Mr. Snelson, I am struck by eight or nine -- I guess I
10 could count them quickly. There are nine nuclear 670
11 megawatt plants built from 2009-and-a-half to 2015. In
12 a period of six years we are building nine CANDU 6s.
13 This looks a lot like the planning in the 70s when
14 there was going to be CANDU "A"s all up and down the --
15 Lake Huron and Lake Superior.

16 MR. SNELSON: A. Well, you have pointed
17 out the number of nuclear reactors in this scenario.

18 I would point out that this is just one
19 illustrative way of meeting the major supply
20 requirements post-2009 and that there are other ways.
21 We have indicated the way using fossil options, and we
22 have also indicated with an enhanced plan some other
23 options that might make part of that.

24 As to the comparison with the 1970s, I'm
25 not quite sure that this is comparable to that.

1 Q. Well, in the 70s you were forecasting
2 in the 90s that you would need about 60,000 megawatts
3 today and we are using about 24. And the thrust, I
4 think you can gather, of my cross-examination yesterday
5 was questioning whether we are going to in fact have
6 this growth in 2009.

7 A. And that is one of the reasons why we
8 are not seeking approvals for major supply options at
9 this time.

10 Q. So do you admit, then, Mr. Snelson,
11 that it is possible that there will not be the forecast
12 growth that we see on page 29 of the overheads?

13 A. Our own load forecast uncertainty
14 bands cover a very wide range as you have pointed out,
15 including a lower range where there is very little
16 growth.

17 Q. And if the Board is to comment on
18 the -- I forget the wording, as Ms. Patterson said, to
19 give you guidance with respect to these, given the
20 difficulties that Ontario Hydro has had with the CANDU
21 "A" with the retubing and a lot of the things we heard
22 on Panel 9, what is the planning perspective on the
23 reliability of the CANDU 6 in putting - at least with
24 this scenario, and I realize you say it is only
25 illustrative - putting all your eggs in one basket, so

1 to speak, with nine CANDU 6s where we don't have any in
2 Ontario?

3 A. Well, I think these are decisions
4 that have yet to be addressed. We have looked at
5 scenarios where all of the base -- we have shown you in
6 update nuclear where all of the base load requirement
7 is provided by nuclear; we have shown in update fossil
8 where it was all provided by fossil.

9 There are possibilities of intermediate
10 scenarios that place less reliance on one or other of
11 those options.

12 Q. And from a planning perspective,
13 then, I take what you are saying is it is better off --
14 we are better off to have a mix?

15 A. Well, we have a mix on the existing
16 system, and we are all the while augmenting that system
17 and the mix is shifting over time.

18 Q. But you haven't given us a mix in
19 2009. You have shown us three scenarios, one of which
20 could be said to be mixed to some extent, but all of
21 which show growth.

22 A. The median scenarios show growth. We
23 have also shown you a low scenario that has very little
24 growth.

25 Q. Yes. And that scenario that shows

1 little growth would have the least environmental
2 impacts; you agree with that?

3 A. It would probably have the least
4 impacts on the natural environment.

5 THE CHAIRMAN: I think they have already
6 agreed with that earlier on this morning and maybe also
7 yesterday afternoon.

8 MR. GREENSPOON: I am almost done, Mr.
9 Chairman.

10 Q. And with respect to the planning of
11 the hydraulic projects, particularly Little Jackfish
12 and Patten Post do they appear in all three of the
13 median scenarios?

14 MR. SNELSON: A. Patten Post is in all
15 the median scenarios. Little Jackfish is in the
16 unmanaged surplus median scenarios but not in the
17 managed surplus median scenarios.

18 MR. GREENSPOON: Those are all my
19 questions. Thank you, Panel.

20 THE CHAIRMAN: Mr. Heintzman?

21 MR. HEINTZMAN: Mr. Chairman, Ms. Findlay
22 is with me to keep me pointed in the right direction,
23 and David Hamer may continue with further questions in
24 specific areas after I have finished.

1 CROSS-EXAMINATION BY MR. HEINTZMAN:

2 Q. Mr. Snelson and Mr. Shalaby and Mr.
3 Dalziel, I would like to pick up on a point that was
4 discussed by you yesterday with the Chairman and Dr.
5 Connell as a result of a question asked by Mr. Rodger,
6 and that is the effect of the moratorium.

7 As I understand the answer given by I
8 think Mr. Shalaby or Mr. Snelson in preparation of the
9 Update, the moratorium was a given?

10 MR. SNELSON: A. That is correct.

11 Q. And by that I understand you to mean
12 that it was given by the government to you as planners
13 and Ontario Hydro?

14 A. Yes, I believe it was a provincial
15 government policy direction as part of the new energy
16 directions in November, 1990.

17 Q. To you as a planner?

18 A. It was a policy direction to Ontario
19 Hydro.

20 Q. And therefore to you as a planner
21 within Ontario Hydro?

22 A. Ontario Hydro's plans are prepared
23 within the framework of provincial government policy
24 where it applies.

25 Q. Well, do you have any problem with my

1 putting it to you as a planner?

2 A. It was put to all of the people who
3 were working on the plans and to all of the people in
4 Ontario Hydro who develop, approve, and so on, plans.

5 Q. Does that include you as a planner?

6 A. Yes.

7 Q. Yes. Thank you. And it was a
8 directive? You considered it a directive within the
9 parameters that it was given?

10 A. Yes.

11 Q. Yes. And as I understand what you
12 said yesterday and Mr. Campbell said when he stood up,
13 that you didn't consider it a directive in the long
14 term. You felt that you could leave nuclear on the
15 table in the long term?

16 A. Yes.

17 THE CHAIRMAN: Well, just a moment. That
18 is not how it was put.

19 [10:55 a.m.]

20 Let's be clear. My impression of what
21 moratorium was, it was simply a request to suspend
22 certain specific work that was being done at that
23 particular time for an indefinite period of time.

24 MR. B. CAMPBELL: That's exactly correct,
25 Mr. Chairman.

1 MR. HEINTZMAN: What I am asking now is
2 the impact of the moratorium on the planning that lead
3 up to the Update. That's where I'm going to.

4 THE CHAIRMAN: Okay.

5 MR. HEINTZMAN: Q. So we now have the
6 directive being not directed to the long-term, it was
7 directed to the short-term in your planning horizon.

8 MR. SNELSON: A. We were told to suspend
9 and not to carry out preliminary engineering for
10 nuclear options.

11 Q. Yes. But I am talking about the
12 planning process that you as a planner, you have told
13 me that you considered it to be a directive within the
14 parameter that was given, you have told us yesterday
15 that that parameter did not include the long-term;
16 right?

17 A. That is correct.

18 Q. So it was a directive given that had
19 application within the short-term, as a planner?

20 A. Yes.

21 Q. Right.

22 A. Though the length of time that it
23 would apply was undefined, but we did consider that it
24 may not be forever.

25 Q. Yes. And the short-term in your

1 perspective in terms of this process was the five-year
2 approval period?

3 A. No.

4 Q. What other short-term period are we
5 working with other than the five-year approval process?

6 A. I believe that there were assumptions
7 made for planning that the nuclear moratorium might be
8 lifted as early as 1993. It wasn't an assumption that
9 it would be lifted, but we did not exclude things that
10 required work on nuclear options post 1993.

11 Q. But that's not a planning matter,
12 that is a question of what engineering work you are
13 going to do.

14 A. It could affect the schedules that
15 that would become a planning matter.

16 Q. Yes. But for a planning perspective,
17 what you are telling us is that you considered it a
18 directive within the short-term.

19 A. It was a directive as to what
20 preliminary engineering we could do within the
21 short-term.

22 Q. No, I don't want to talk about what
23 preliminary engineering you could do. From a planning
24 perspective, and the Update is a planning document;
25 correct?

1 A. Yes.

2 Q. That's what I am trying to focus on.
3 The planning perspective, you as a planner considered
4 it to be directive?

5 A. Yes.

6 Q. Right. You didn't consider it to be
7 a directive in the long-term?

8 A. Yes.

9 Q. You considered it to be a directive
10 in the short-term?

11 A. Yes.

12 Q. All right. Now, the short-term for
13 you was the five-year approval period?

14 A. No.

15 MR. B. CAMPBELL: Mr. Chairman --

16 THE CHAIRMAN: Let him answer.

17 MR. B. CAMPBELL: My point, Mr. Chairman
18 is that he has already answered the question.

19 THE CHAIRMAN: That may be so, but let us
20 have the answer to that.

21 MR. SNELSON: The short-term in this
22 context is not the five-year planning period.

23 MR. HEINTZMAN: Q. What other short-term
24 period are we dealing with?

25 THE CHAIRMAN: Just a moment. I thought

1 Mr. Snelson said today, and this is a repetition of
2 what was said at earlier panels, that Hydro proceeded
3 on the basis that there was a possibility that this
4 moratorium might be lifted as early as 1993. That's
5 what I thought they said before and they said again
6 today. That was the planning framework that they were
7 working in.

8 Now, whether that's short term, long,
9 medium term, whatever, I don't know.

10 MR. HEINTZMAN: Q. That may be true and
11 it may be lifted in 1993, but it hasn't within lifted
12 or it wasn't lifted at the time you prepared the
13 Update.

14 MR. SNELSON: A. That is correct.

15 Q. So that's what I am trying to get at,
16 the effect it had on you as a planner. I am suggesting
17 that there sitting in November of 1991 you had a
18 nuclear moratorium.

19 A. Yes.

20 Q. You were taking that as a short-term
21 planning directive?

22 A. Yes. The short-term that you were
23 working with in your Update was the five-year approval
24 process?

25 A. No, not with respect to the nuclear

1 moratorium.

2 Q. Well, I am having trouble discerning
3 how it could be otherwise. Because you have told the
4 Chairman yesterday that if nothing had happened, i.e.,
5 you hadn't prepared the Update, but we had the same DSM
6 as we have had and we had the same NUGs as we have had,
7 and we had the nuclear moratorium, what we would have
8 was Plan 15 or Plan 22 or Plan 23 before the Board;
9 right?

10 A. No, I don't believe I did say that.
11 Well, if we didn't have the Update, yes, they would be
12 in front of the Board, but there would still be a need
13 to do an update.

14 Q. Well, the Update would be done by way
15 of submissions to this Board and the evidence before
16 the Board and the Board would have to make a decision
17 based upon the evidence and your evidence in this panel
18 as to what the appropriate approvals would be; right?

19 A. Yes.

20 Q. Right. But the one thing that the
21 Update does is take the five-year approvals off the
22 table; right?

23 A. It takes some of the approvals off
24 the table.

25 Q. It takes all of the major supply

1 approvals off the table?

2 A. It takes all of the approvals off the
3 table except for the Manitoba Purchase transmission and
4 the new hydraulic.

5 Q. So it takes what we have been calling
6 all the major supply approvals off the table?

7 A. It takes all the approvals off the
8 table for major fossil and nuclear options, yes.

9 Q. I am suggesting to you that the
10 inevitable logic of what has happened here is this:
11 That you determined that you could not put forth an
12 approvals case with nuclear as part of the major supply
13 because of the nuclear moratorium; isn't that the fact?

14 A. No.

15 Q. And I suggest to you that the
16 inevitable next decision you made was, if you had the
17 nuclear supply off the table, you had to take the
18 fossil off the table. That would be true, wouldn't it?

19 A. Well, it wasn't true in the case of
20 the nuclear and it wasn't true in the case of the
21 fossil.

22 Q. Well, others will judge that.

23 But if the nuclear had to be taken off
24 the table because of the nuclear moratorium, certainly
25 the fossil had to be taken off; wouldn't you agree with

1 that?

2 A. I wouldn't agree with that, no.

3 Q. Would you agree that responsibly you
4 could put the major supply case forward without nuclear
5 as one of the approval options and put forth an option
6 having only fossil in it?

7 A. We could do that, yes.

8 Q. Well, you could, but you know that
9 the five cases that were analyzed in their sort of
10 latter day stages had one case in it which was entirely
11 fossil, namely Case 26, all other cases had some
12 nuclear in it; right?

13 A. That is correct.

14 Q. That is correct.

15 And that Case 26 was rejected - and we
16 are going to go through in some detail - was rejected
17 by the DSP in the final analysis and the three put
18 forward, Case 15, Case 22 and Case 24, all have some or
19 more nuclear?

20 A. Yes.

21 Q. Yes. So I am suggesting to you that
22 as a responsible process you could not put forward a
23 major supply case that did not have the nuclear as an
24 alternative in that environment; could you?

25 A. The nuclear is an alternative.

1 Q. Yes.

2 A. It's an alternative in this
3 proceeding too.

4 Q. If you are asking major new supply
5 you couldn't put forth a scenario or a choice to this
6 Board that did not include one that had some approval
7 nuclear generation; could you?

8 A. I haven't agreed with that, and I
9 don't agree with that.

10 Q. Well, why do you not agree with me
11 based upon the logic of what we see in the DSP?

12 A. It's based upon the information that
13 was available at the time of the DSP and the
14 information available today.

15 Q. So, you say that you responsibly as a
16 utility could put forward to this Board a selection of
17 options which included fossil only alternatives; is
18 that your evidence?

19 A. For approval, yes.

20 Q. Well, I suggest to you that what
21 happened was, (A), you decided as a matter of directive
22 you had to take off nuclear as included in the
23 five-year approval process and that resulted in you
24 taking off the fossil, and I will leave that with you
25 there. But if that is the case, then you had to show

1 the nuclear coming on at a period in time at least
2 outside the period of definition and acquisition after
3 your estimation of when this Board would reach its
4 decision plus five years?

5 A. I think you have the process
6 backwards.

7 Q. Well, as we go through the
8 alternatives, it won't be surprising if every one of
9 the nuclear commencement dates is 2009 and 2010?

10 A. I'm sorry, is that a question?

11 Q. Yes. It won't be surprising to you
12 that every plan we look at, the first nuclear
13 commencement date on any projected major supply is 2009
14 or 2010, without exception?

15 A. The plans that are based upon the
16 current situation where we are not seeking approvals,
17 do show nuclear at later dates, 2009 or later.

18 Q. Without exception?

19 A. That is correct.

20 Q. Yes. And that happens to be what
21 you, as you have already told us to be, the five-year
22 approval process, plus one year, plus a 10-year
23 acquisition or definition phase for nuclear?

24 A. That does correspond to about those
25 dates, yes.

1 Q. Yes. And I am suggesting to you,
2 sir, that based upon your answers yesterday to the
3 chairman and the analysis that I have just given to
4 you, that the only reasonable conclusion is that which
5 I have put to you; namely, that you had to take nuclear
6 generation off the table in the approval process for
7 approvals within the five years because of the nuclear
8 moratorium?

9 A. That's not correct.

10 Q. Now, in the DSP, sorry, Update, 452,
11 as you have told us there are six plans - and I put
12 this to any members of the panel, but I am talking to
13 with you, Mr. Snelson - there are six plans which you
14 discussed with Mr. Mark.

15 A. 452 discusses six plans, yes.

16 Q. And what I would like to do is, if I
17 can, take out or compare apples to apples and good
18 apples to good apples and not good apples to bad
19 apples. That's the process I want to go through with
20 you in of the next little while.

21 Now, looking at the three basic plans,
22 the nuclear plan, the fossil plan and the enhanced
23 plan, the nuclear plan is in fact about one-third
24 fossil generation. Have I got that right?

25 If you look at Exhibit 682, page 30 and

1 33.

2 A. I'm sorry, the question was?

3 Q. The nuclear plan is about one-third
4 fossil.

5 A. The update nuclear plan uses nuclear
6 for base load requirements and fossil for peaking
7 requirements. It's about in the proportions you are
8 talking.

9 Q. So I am correct, am I?

10 A. I believe so, in capacity terms, yes.

11 Q. And you say that the fossil is
12 peaking, I was a little bit confused on that. When you
13 look at page 30 of Exhibit 682, we can see there, if we
14 add up the total generation on page 30, in the nuclear
15 median case, 8,718 megawatts on my addition, and the
16 third up from the bottom, is a CTU CC, which you say is
17 peaking; is that correct? Do you have that in front of
18 you?

19 A. Yes, I do. Yes, that is peaking.

20 Q. And then the next unit is a CTU IGCC,
21 and when I look and compare that to the next page, 31,
22 the fossil plan, and the next page, the enhanced plan,
23 I have trouble figuring that to be a peaking plant
24 rather than a base load plant.

25 Are you telling me that IGCC on page 30,

1 about four up from the bottom, is a peaking plant?

2 A. Yes. The CTU/CC and CTU/IGCC in this
3 plan only the combustion turbine unit phases are
4 developed for peaking purposes. They have the
5 flexibility to go beyond that in our proposals, but
6 only the peaking part is developed.

7 Q. So that in this plan the IGCC is not
8 intended to be carried out within the planning period;
9 is that what you are saying?

10 A. That is correct.

11 Q. Does that apply to the other plans on
12 pages 31 and 32?

13 A. It applies to the ones on page 30. I
14 think if you look at pages 31 and 32, you will see that
15 IGCC is identified as IGCC and not CTU/IGCC, and that
16 intended to indicate that it would be developed as the
17 IGCC.

18 Q. So in fossil plan on page 31, are
19 those three first IGCCs, 659 megawatts, 1,318
20 megawatts, and 659 megawatts, are they peaking plants
21 or are they base load plants?

22 A. They are capable and designed to be
23 suitable for base load.

24 Q. I am just having a little difficulty
25 with the mathematics as to how that CTU/IGCC is a

1 peaking plant if all the four first plants on page 31
2 are base load. Can you help me on that?

3 THE CHAIRMAN: I think he said designed
4 for base load, but can I infer from that capable of
5 being used for peaking?

6 MR. SNELSON: All plants have the
7 capability of being used over a range of capacity
8 factors. And so there is some lack of precision in
9 precisely defining whether a plant is a base load plant
10 or an intermediate plant or a peaking plant, and it
11 also depends how they work with the existing system
12 which also can be shifting its role slightly through
13 different plans.

14 MR. HEINTZMAN: Q. Well, looking at page
15 30 then much, should we just not show all the CTUs as
16 being CTUs without the prefix IGCC in terms of the
17 planning period?

18 MR. SNELSON: A. That is how they are
19 developed within the planning period.

20 Q. I don't see any designated CTU/IGCC
21 on the other two plants, the fossil or the enhanced.
22 Is there any reason for that?

23 A. I think on the fossil plant you do
24 see some CTU/CCs which would be used for peaking
25 purposes.

1 Q. We don't see any CTU/IGCCs, is there
2 any reason for that?

3 A. The IGCCs are being developed to
4 their IGCC potential for use as base load, because the
5 base load fossil, they are being used as base load
6 fossil substantially to replace the base load nuclear
7 of the nuclear plan.

8 Q. Then at the top on page 30, your
9 second last unit is a CTU/IGCC of 1,344 megawatts. Are
10 you saying that is a peaking unit?

11 A. Yes.

12 Q. 1,344 megawatts?

13 A. It isn't necessarily one unit, but
14 it's 1,344 megawatts of capacity, yes.

15 Q. That's a huge amount, if it's one
16 plant it's a huge peaking plant?

17 A. It isn't necessarily one plant. It
18 certainly isn't necessarily one unit.

19 Q. I said if it was a one unit it is a
20 huge peaking plant?

21 A. If it were to be one unit, it would
22 to be a very large peaking plant, yes.

23 Q. Could you look with me at page 33 of
24 this exhibit, 682, and under the fossil column you will
25 see 1.3 gigawatts of CTUs and under the nuclear plan,

1 2.7 gigawatts of CTUs. Can you explain to me why you
2 would have more CTUs in the nuclear so-called plan than
3 in the fossil plan?

4 [11:16 a.m.]

5 MR. DALZIEL: A. One of the reasons for
6 that is the pattern in which the IGCC facility can come
7 into service and that an equivalent amount of capacity
8 is coming in at a more compressed period, three years
9 as opposed to four years.

10 Q. Which is more compressed?

11 A. The IGCC facility.

12 Q. In any event, Mr. Snelson or Mr.
13 Dalziel, when we look at the various charts starting at
14 about page 39 and going through page 50 showing us the
15 so-called update nuclear and showing us, for instance,
16 relatively high SO(2) or NOx or whatever emissions on
17 the so-called nuclear Update, they are a product
18 entirely not of the nuclear element but of the fossil
19 one third element that you have included in the plan?

20 A. They are product of the plan: the
21 update nuclear plan, the update fossil plan, and on
22 those charts the enhanced plan as well. So those are
23 plan characteristics that are being illustrated there.

24 Q. But they are a characteristic of the
25 fossil element, not of the nuclear element?

1 A. In each one of those graphs you are
2 correct. Certain of the characteristics may be more
3 attributed to one option or perhaps even entirely to
4 one option as opposed to another.

5 Q. The ones I referred to, the SO(2),
6 the NOx, the acid gas, are all attributable to the
7 fossil element that you have kept in the so-called
8 nuclear Update?

9 A. And the existing system.

10 Q. And the existing system, of course.
11 But what you haven't put forward is what I will call a
12 high nuclear case where you have either no new fossil
13 or a very limited small proportion of fossil; that's
14 correct, is it?

15 MR. SNELSON: A. I think the update
16 nuclear case that we put forward uses nuclear for all
17 of the base load requirement, additional base load
18 requirements for which nuclear is suitable.

19 Q. Yes, but my question was: You have
20 not put forward a case of the six that has all of the
21 new generation as nuclear or a very small proportion of
22 the new generation as fossil; is that not correct?

23 A. In capacity terms, that is correct.

24 Q. Yes. Now, let's compare that to the
25 DSP.

1 First of all, if we could turn to page
2 15-9 where we look at Case 15, what I am going to
3 suggest to you is that in the DSP there were three
4 cases which ended up being approved for consideration,
5 Case 15, Case 22 and Case 24. You are aware of that,
6 Mr. Snelson?

7 A. Yes.

8 Q. And all of those had some degree of
9 nuclear generation, ranging from Case 22 with the
10 highest, to Case 24 at the lowest, and Case -- sorry,
11 Case 22 at the highest; Case 24, medium; Case 15,
12 somewhat lower in terms of the amount of nuclear
13 generation?

14 A. Can I have that again, I think it was
15 Case 22 with the higher nuclear, Case 15 with the
16 median nuclear, and Case 24 with less.

17 Q. All right.

18 A. Yes.

19 Q. And what you have presented here
20 basically in your nuclear Update is a version of Case
21 15?

22 A. I think it is quite similar to Case
23 15 in the concept of using nuclear for base load and
24 combustion turbine for peak load.

25 Q. And let's look at page 15-9, and we

1 see the graph which I will be coming back to you with
2 respect to how Case 15 unfolds from the upper to the
3 median to the lower load forecast.

4 But in the paragraph on the left-hand
5 side of the page it says:

6 Under the median load forecast the
7 base load requirement is supplied by
8 nuclear generation with in-service dates
9 set by cost and environmental
10 considerations. The intermediate
11 requirement is met by existing fossil
12 stations, retrofitted as necessary to
13 meet environmental requirements. The
14 remaining peaking requirement is met by
15 CTUs, convertible to CCs or IGCCs.

16 So Plan 15 contemplated base load
17 nuclear, peaking through new fossil; correct?

18 A. It envisaged nuclear for base load
19 and peaking through new fossil combustion turbine
20 units, in some cases convertible to CC or IGCC.

21 Q. So that is basically identical to
22 what you have provided for in the update nuclear
23 so-called case?

24 A. As I have said, the update nuclear
25 follows a very similar philosophy to this plan, yes.

1 Q. Well, it is identical, isn't it?

2 A. The numbers are different, but the
3 concept is the same.

4 Q. So all you have done is you have
5 taken the identical concept or plan philosophy and just
6 had the computer readjust the result to present day
7 circumstances?

8 A. I think there was a little more than
9 just the computer doing it, but in concept, yes.

10 Q. All right. Now, let's look at Case
11 23, and that is found on page 15-16. Sorry, this
12 should be -- yes, Case 23, let's do that next, on page
13 15-16. It tells us:

14 In this case more than 85 per cent of
15 new capacity under each load forecast
16 condition consists of purchases and base
17 load nuclear generation.

18 And then if we drop down three paragraphs, second
19 sentence:

20 In-service dates of nuclear units are
21 scheduled to meet all requirements for
22 new capacity, both base load requirements
23 and some intermediate requirements.
24 Existing fossil moves towards the peaking
25 role and no new peaking generation is

1 required.

2 See that?

3 A. Yes, I do.

4 Q. And when we look on the right-hand
5 side we can see under the low forecast, which is the
6 one to the right, that it is all nuclear except for a
7 CTU in or around the year 2012, something like that?

8 A. Yes.

9 Q. And that plan works on the basis that
10 you use existing generation for peaking power and
11 basically all your new generation is nuclear
12 generation?

13 A. Yes, as described in that paragraph
14 and the figure.

15 Q. And that plan was put forward so that
16 if someone was concerned about CO(2), greenhouse gases,
17 acid gases, that case would be available for selection
18 as the most aggressive case to meet that kind of
19 environmental consideration; is that fair to say?

20 A. It was put forward in case that was
21 to be chosen for a balance of reasons, and the reasons
22 you have suggested would be some the favourable reasons
23 for selecting that plan.

24 Q. Yes. And that case is not one that
25 you have included within the cases that you have put

1 forward in the Update, is it?

2 A. That is correct.

3 Q. Yes. And if it had been included,
4 and we can go through the DSP, it would be a less
5 expensive plan than the nuclear so-called Update plan?

6 A. No.

7 Q. You don't think it would have been
8 less expensive?

9 A. No.

10 Q. It would have resulted in lesser
11 SO(2), acid gases, NOx, and CO(2)?

12 A. I would expect so in the period
13 post-2009 when major capacity is required.

14 Q. It would have resulted in more
15 economic benefits to Ontario if we read the discussion
16 of the DSP?

17 A. I don't think we have done that
18 specific analysis under the current circumstances.

19 Q. But the logic contained in the DSP
20 would indicate that?

21 A. There would be a tendency in that
22 direction because of the high Ontario content of
23 nuclear options.

24 Q. Right. Then let's look at Plan 22,
25 and that is on page 15-24, I think.

1 And Case 22 was - we can reflect at page
2 19-3 - was one of the three approved plans or one of
3 the three plans put forward by Ontario Hydro for
4 approval in the DSP?

5 A. Ontario Hydro indicated that this was
6 a plan for which it would accept approval, yes.

7 Q. Yes. And it says on page 15-24:
8 This case is between Case 15 and Case 23; right?

9 A. That is correct.

10 Q. So what it is telling us is - and we
11 will read this - is that it contains: more nuclear
12 generation than Case 15 and less than Case 23?

13 A. Yes.

14 Q. Right. And if we read the next
15 paragraph:

16 Under the median load forecast nuclear
17 units are scheduled to reduce the need
18 for new fossil generation until later in
19 the period. This case requires by 2014
20 12 CANDU units at three stations, 6 CTU
21 stations, and 16 CTU/IGCC stations;
22 right?

23 A. It says "16 CTU/IGCC at two
24 stations".

25 Q. Yes. Right. And so what this plan

1 does, it says that all new generation or all generation
2 within the early part of the plan will be nuclear, and
3 it is only later in the plan that fossil peaking will
4 be provided, so that it contemplates the early period,
5 the peaking power being met by existing generation, all
6 new generation being nuclear, and then later in the
7 period using fossil to do some peaking. That is the
8 basic thrust of this plan?

9 A. That's correct.

10 Q. Right. And again, this is not a plan
11 which you have taken and adopted in the Update?

12 A. No.

13 Q. Am I correct?

14 A. You are correct.

15 Q. Well, let's go on to the next case,
16 and that is your fossil case. The fossil case is at
17 page 31 of Exhibit 682, and on page 33 --

18 THE CHAIRMAN: I wonder if we could take
19 the break. Would that trouble you too much?

20 MR. HEINTZMAN: It is a good spot.

21 THE REGISTRAR: Please come to order.
22 This hearing will take a 15-minute recess.

23 ---Recess at 11:30 a.m.

24 ---On resuming at 11:52 p.m.

25 THE REGISTRAR: Please come to order.

1 This hearing is again in session. Please be seated.

2 MR. HEINTZMAN: Q. Mr. Snelson and Mr.
3 Dalziel, we were just about to discuss the fossil case
4 in the Update, and that case contains only fossil
5 generation as we see from page 33 of Exhibit 682 and no
6 nuclear generation at all. That's correct, is it?

7 MR. SNELSON: A. That's correct.

8 Q. Now, in the DSP there was one such
9 plan and that was Plan 26, which we will find on page
10 15-13 of Exhibit 3. Do you recall that?

11 A. Yes, I recall that. I am just
12 looking up the reference. 15...?

13 Q. 15-33. It is graphically
14 represented. 15-13.

15 A. Yes, I have it.

16 Q. And that case was rejected by the
17 planners in Exhibit 3 and was not put forward as one of
18 the recommended plans; is that not the case?

19 A. Ontario Hydro did not put it forward
20 as one of the recommended plans.

21 Q. But you have included it as in effect
22 part of and one of the alternatives in the Update?

23 A. We have included a plan that is all
24 fossil, but it has a much lesser amount of fossil
25 capacity than was planned.

1 Q. Well, it has the same amount of
2 fossil capacity as the low case in Case 26. Basically,
3 as we will see, your median case in each scenario
4 because of events is the low case in each of these
5 plans. Isn't that basically the case? I will be
6 coming back to that, but...

7 In any event, there --

8 A. It appears to be approximately so in
9 terms of the total capacity by the end of the planning
10 period.

11 Q. Yes. And if we turn to page 15-70 of
12 the DSP, the disadvantages of Case 26 and the
13 advantages are set forth on page 15-70, and the
14 pronounced disadvantage really relates to meeting CO(2)
15 targets, et cetera, and other disadvantages relating to
16 emissions; correct?

17 A. There is also a 97 per cent
18 probability of Case 26 being higher cost than Case 15.

19 Q. Yes. So there was a cost
20 disadvantage, but is it fair to say when you read the
21 DSP that the most materially and certainly the
22 environmental reason why Case 26 was not put forward as
23 a preferred option was due to the acid gas --

24 I am just reading the second bullet under
25 the heading "Disadvantages": CO(2) targets,

1 flexibility to meet tighter acid gas regulations or
2 CO(2) regulations, has the lowest Ontario goods and
3 services content, poor balance of trade, vulnerability
4 to approval delays.

5 You see all of those disadvantages?

6 A. Yes, I do.

7 Q. Those are all disadvantages inherent
8 in a total fossil case?

9 A. Directionally, yes.

10 Q. Yes. So directionally put, the same
11 disadvantages adhere to the fossil case that you have
12 included in the Update?

13 A. In terms of higher emissions, and we
14 have shown that in our evidence.

15 Q. Yes. And also in terms of
16 flexibility, vulnerability to approval delays, lower
17 Canadian content, et cetera? Those are all
18 characteristics of the total fossil case?

19 A. The vulnerability to approval delays
20 may not apply.

21 Q. The others do?

22 A. To the extent that the nuclear option
23 that is chosen is an option with high Ontario content,
24 such as a CANDU option, then I would expect that there
25 would be disadvantages with respect to the Ontario

1 economic content and the balance of trade.

2 Q. And the flexibility when you are
3 using only one supply, i.e. fossil alone, the authors
4 of this report say that that reduces flexibility? And
5 that applies as well to Case 26 as it does to the
6 Update fossil.

7 A. There is more flexibility with a
8 greater range of options.

9 Q. Yes. But you put forward the Update
10 fossil.

11 A. We have put it forward as an
12 illustration of how the major supply component might be
13 met.

14 Q. Now, the DSP had another what I will
15 call fossil alternative, and that is Plan 24 or Case
16 24, and that is on page 15-20. As we see from the top
17 of page 15-20 of Exhibit 3, this is a case between Case
18 15 and Case 26. So it has more fossil in it than Case
19 15 and less than the total fossil case, Case 26?

20 A. That is correct.

21 Q. But it does contain nuclear
22 generation?

23 A. Yes.

24 [12:00 p.m.]

25 Q. And this is a case which you could

1 put forward if you wanted to go to fossil direction but
2 derive some benefits that nuclear generation has in
3 terms of lower cost, emissions, et cetera. That's what
4 the authors of this report tell us?

5 A. That's correct.

6 Q. But that's not an alternative which
7 you have put forward in the Update?

8 A. As I said, the Update puts forward
9 two illustrative cases towards -- not necessarily at
10 the outer bounds, but towards the bounds of the range
11 of major supply options that might be chosen.

12 Q. We have seen that the outer bounds,
13 if you want to consider that, is Case 22 on the nuclear
14 side, and you didn't put that case forward at all?

15 A. That is correct.

16 Q. So what you have done is on the
17 nuclear side you have left off the two plans that are
18 one side of the Case 15; right?

19 A. We have not included a higher nuclear
20 option than the update nuclear, and that is comparable
21 to Case 15, yes.

22 Q. You have left off the two cases that
23 are more nuclear than Case 15; right?

24 A. That is correct.

25 Q. And you have included on other side

1 the most fossil of all of the fossil cases to the other
2 side of Case 15; correct?

3 A. That is correct.

4 Q. So what you have included is of the
5 three recommended plans in the DSP, you have included
6 one and left out two of the ones that are put forward.
7 Case 24 being the slightly fossil side, Case 22 being
8 the slightly nuclear side and Case 15 being the nuclear
9 based and fossil peaking. Of those three recommended
10 plans in the Update you have only put forward one of
11 those, in effect the Case 15; right?

12 A. As I have said, these are
13 illustrative and, yes, you are correct, that those are
14 the cases that we put forward, an all fossil plan and a
15 mixed nuclear for base load, fossil for peaking plan.

16 Q. Just stay with me. Of the three
17 recommended plans of the DSP, in the Update you have
18 only put forward one; right?

19 A. Where I am having my difficulty here,
20 what we had established is that there are certain
21 philosophies behind the plans and that I have accepted
22 that the update nuclear has a similar philosophy to
23 Case 15 and similar approach to Case 15, and yes, we
24 have put that forward. We have put forward a plan with
25 a similar approach to the all fossil plan which was

1 Case 26, I think was the number. And we have put
2 forward those two cases as illustrative of a range of
3 ways in which major supply could be met.

4 We have not put forward plans that have
5 the same philosophical approach as Case 22, which is
6 higher nuclear, or Case 24, which is higher fossil,
7 although you could judge that the higher fossil plan is
8 encompassed between the update nuclear and the update
9 fossil plans that we have used for illustrative
10 purposes.

11 Q. If I can have an answer to my
12 question.

13 THE CHAIRMAN: I think that's not a bad
14 answer. I think that is a pretty good answer.

15 MR. HEINTZMAN: Q. Let me have an answer
16 to this question then. Of the three recommended plans,
17 plan philosophies, if you prefer I use that word.

18 MR. SNELSON: A. Yes.

19 Q. You have put forward one of them in
20 the Update, i.e., the plan philosophy in Case 15 and
21 not the plan philosophies in Case 22 and 24?

22 A. That's correct, as I indicated in my
23 previous answer.

24 Q. And of one of the rejected plans
25 philosophies in the DSP, namely Case 26, you have

1 included that in your Update?

2 A. Yes.

3 Q. Now, can you explain to me why you
4 have not included the case philosophy in Case 22, so
5 that those who wish to make a choice that greenhouse
6 gases, who wish to make the choice -- if you turn to
7 page 15-71, and if you could look at that page in
8 conjunction with 15-8.

9 THE CHAIRMAN: I am sorry, 15-?

10 MR. HEINTZMAN: 15-8 of Exhibit 3.

11 Q. If you could just have your hand...
12 15-8 sets forth sort of the basic ideas
13 behind each of the Cases 15, 26, 23, 24 and 22. You
14 see that?

15 MR. SNELSON: A. Yes, I do.

16 Q. And basically setting forth that if
17 you are very concerned about greenhouse gases, CO(2),
18 and whatnot, then you are going to go with Case 23; do
19 you see that?

20 A. Yes.

21 Q. And if you want to accomplish Case 23
22 but with not quite so much nuclear then you would go
23 with Case 22, et cetera. Those choices are being made.
24 And the authors at page 71 of Chapter 15 say cases 15,
25 22 and 24, acceptable. Do you see that?

1 A. Yes.

2 Q. And they set out the criteria derived
3 from the DSP and general planning considerations that
4 led them to arrive at a conclusion that Cases 15, 22
5 and 24 were the acceptable ones?

6 A. Yes.

7 Q. Now, can you tell me why you didn't
8 include, as part of the Update, those choices which
9 could then be available for consideration by this Board
10 in terms of what Ontario Hydro was asking for in
11 long-term planning consideration you say that you are
12 interested in?

13 A. I believe that there has been some
14 discussion as to the meaning of those long-term
15 planning considerations, and the primary thing that I
16 believe has to be addressed, and maybe we are getting
17 into legal territory here, is the alternatives to the
18 approvals requested, and the approvals that we are
19 requesting are with respect to Manitoba Purchase and
20 transmission and the hydraulic approvals.

21 Q. That's an interesting answer. Are
22 you saying that Plans 15, 22 and 23 are being put
23 forward as alternatives to the Manitoba Purchase?

24 A. No, that was in 1989. In 1989 we
25 were seeking approval of major supply options, nuclear

1 and fossil major more supply options, as well as
2 hydraulic and Manitoba Purchase transmission.

3 Q. I appreciate that. But my question
4 was, why haven't you in the Update, when you put
5 forward future scenarios, included Cases 22 and 24
6 which are or were considered to be acceptable in the
7 DSP process which took some, I guess, eight years by
8 the time it got to the fall of 1991 acceptable
9 alternatives?

10 A. Well, in 1989 we felt that we needed
11 to make decisions and we were asking approvals for
12 nuclear and fossil major supply options and so it was
13 important that there be a range of nuclear and fossil
14 major supply options available for consideration.

15 Under the current circumstances we are
16 not seeking approval for major fossil and nuclear
17 options, and the major supply plans post 2009 are
18 provided for illustrative purposes as a background to
19 the analysis of the rest of the plans. We are not
20 necessarily asking for selection of either the update
21 nuclear or the update fossil. We are indicating that
22 covers a range of possible futures.

23 Q. Well, it doesn't, as we have seen,
24 span the entire range. You have agreed with me on
25 that.

1 A. That's correct.

2 Q. You could have just left off and not
3 had anything in the Update at all about the nuclear and
4 just ignored the future and said, we don't want to talk
5 about major new supply at all, and the report ends
6 there. But in fact you put forward cases which are
7 from a philosophic standpoint, and except for rejigging
8 the numbers, Case 15 and Case 26, and I want to know
9 why in that scenario you did not put forth a planning
10 philosophy that had Case 22 and 24 in it and Case 23?

11 A. Can I come back to the first part of
12 your question. You said we that could have stopped
13 without going to the stage of major supply plans. I
14 don't believe that that is the way in which would be
15 reasonable to do planning because when seeking approval
16 of facilities or when considering whether or not to
17 build facilities for, say, in-service around the year
18 2000, then in evaluating that we want to know how the
19 future may play out and how those options may be used
20 over their lifetime, and so we, in planning, simulate
21 the operation of these facilities and their effects on
22 the system for a significant part of their operating
23 period.

24 Q. So you are saying that in giving
25 consideration to the approvals that are requested, you

1 are influenced by your long-term view of what the
2 system is going to look like?

3 A. Yes.

4 Q. And what the system is going to look
5 like is going to be what you are going to have in your
6 major new supply?

7 A. That also influences what the system
8 will look like over the long-term, yes.

9 Q. So it's part and parcel of giving
10 consideration to the approvals that are asked for, you
11 say of the next five years, what the long-term major
12 generation of Ontario Hydro will be?

13 A. Yes.

14 Q. I guess that accentuates my question
15 as to why in that event you didn't put forward a Case
16 23, Case 22 and Case 24 so that the Board would have
17 those choices so it would be aware of the long-term
18 configuration or what Ontario Hydro might look like in
19 the long-term if you say it is important in making
20 those short-term decisions?

21 A. The specific of that question I think
22 I would like to separate into two parts.

23 First of all, with respect to a plan that
24 has an amount of fossil generation that's between Case
25 15 and Case 26 that would be similar in philosophy to

1 Case 24, and that wasn't done in the illustrative range
2 of major supply options post 2009 because it's
3 essentially unencompassed between the update nuclear
4 and the update fossil plans. And so for judgmental
5 reasons, if you have looked at those two outer extremes
6 then you can judge that this other sort of approach
7 would be somewhere in between.

8 Q. Can I stop you there or do you want
9 to finish your answer, because I have a question that
10 arises out of that?

11 a. Let's deal with that.

12 Q. I suggest to you that Case 24 is
13 fundamentally different than Case 26. If you would
14 like at me at page 15-71, and particularly under the
15 third column on the right under resource smoothing and
16 approval delays which I suggest to you will be very
17 important considerations to us as we debate this
18 matter.

19 First of all, under resource smoothing
20 under median and upper forecast, Plans 15, 22, 24
21 acceptably maintain the capability to the design,
22 manufacture and construct nuclear and fossil
23 generation. Under the lower load forecast there is a
24 significant interruption in the nuclear program which
25 would adversely affect maintaining the CANDU options,

1 and under approval delays, Plan 24 is less vulnerable
2 to the impact of approval delays than the other plans.

3 So two important characteristics of Plan
4 24 was that it maintained the CANDU option, i.e., there
5 is CANDU in the plan so you start working on it; (B),
6 it resource smoothes, and (C), it's less vulnerable to
7 delays in approvals. That's what the authors were
8 telling us.

9 A. For the specifics of those plans as
10 evaluated at that time, yes.

11 Q. Well, the same would be true today,
12 that if you put forward a Case 24 against a Case 26, it
13 would have those criteria that are reflected by the
14 authors here in the difference between Case 24 and Case
15 26?

16 A. To a degree, yes.

17 Q. So I suggest to you that not putting
18 forth a Case 24 is not just a case of leaving out the
19 intermediary case, it's leaving out the key ingredients
20 of an approved plan that Ontario Hydro thought was
21 worthy of approval.

22 A. We thought that was worthy of
23 approval in 1989 when we were seeking approval of major
24 supply options.

25 As I have indicated, the major supply

1 options at the moment from 2009 on are illustrative.
2 We are not seeking approval of them.

3 Q. Well, sir, I have asked you now I
4 guess four times why you didn't include Plans 15, 22
5 and 24 in the Update.

6 A. I have told you why we didn't include
7 Plan 24.

8 Q. So you told us all the reasons?

9 THE CHAIRMAN: He hasn't told you yet
10 about Plan 22. He hasn't got to that yet.

11 MR. HEINTZMAN: Sorry.

12 Q. You told us all about Plan 24?

13 MR. SNELSON: A. That's correct.

14 Q. Tell us about Plan 22.

15 A. I believe that Ontario Hydro - and I
16 indicated this in my direct evidence - has had a
17 distinct shift in its stated preference of nuclear for
18 base load options.

19 Q. Well, that may very well be, but it's
20 up to this Board to examine that philosophy; isn't it?

21 A. That is correct.

22 Q. And it's not a question of Ontario
23 Hydro prejudging that; is it?

24 A. Ontario Hydro is putting forward the
25 plans that it considers to be reasonable given the

1 current circumstances.

2 Q. But the whole idea, I understood, of
3 this process was you put forward certainly what you
4 think are the preferences, but you put forward the
5 alternative methods and the alternatives; right?

6 MR. B. CAMPBELL: Mr. Chairman --

7 THE CHAIRMAN: Just a moment. Why can't
8 he answer that question?

9 MR. B. CAMPBELL: I am quite prepared to
10 say he has put forward, he has already said he put
11 forward the alternatives. But I take my friend's
12 question as being aimed at what the obligations of the
13 proponent are.

14 THE CHAIRMAN: Let's put it this way. If
15 the proponent is required to put forward the
16 alternatives, why wouldn't you put this alternative
17 forward? That question can be answered.

18 MR. SNELSON: We have put forward
19 alternatives in different ways. We have talked about
20 alternative options, we have described them in terms of
21 their environmental impacts, their levelized unit
22 energy costs, a variety of characteristics of the
23 options. It's a smaller group of -- way of selecting
24 the options and putting them together into plans that
25 we have put forward. And as we have indicated, the

1 update nuclear is one of the plans that indicates the
2 effect of adding nuclear as an option.

3 MR. HEINTZMAN: Q. Well, if you want to
4 put forward all of the options -- let me just
5 understand this. Are you saying that the philosophies
6 in Cases 22 and 23 are now outside the bounds of
7 Ontario Hydro's acceptable philosophies from a planning
8 standpoint?

9 MR. SNELSON: A. Well, we haven't
10 specifically had to make a decision on that because we
11 don't need to make the decisions for post 2009 at this
12 point in time, so you make the decisions when you need
13 to make them. But there has been a significant shift
14 in corporate thinking, in the corporate position with
15 regard to the attractiveness of nuclear and fossil as
16 base load options.

17 Q. All right. So you have told you
18 don't have to make the decisions, so I would therefore
19 assume that Cases 22 and 23 aren't yet outside the
20 philosophic bounds of Ontario Hydro from a planning
21 stand point; would I be correct?

22 A. As I say, we haven't had to make that
23 decision, but I believe if we had to make that
24 decision, then it is less likely that they would be
25 acceptable today.

1 Q. But it's not definitive; is it?

2 A. It is definitive to the degree that
3 the update fossil and the update nuclear plans were the
4 plans that were put to the board of directors in the
5 same way that the previous plans were put to the board
6 of directors but, as I say, now under new circumstances
7 and they were the plans that were accepted by our board
8 of directors.

9 Q. That's quite an answer. That says
10 then this the board of directors has made a choice to
11 that extent.

12 A. To the extent that they accepted
13 plans showing that those illustrations of how future
14 major supply options may be met.

15 Q. I think you have told us then that
16 the higher nuclear case, of Case 22, wasn't put to the
17 board?

18 A. It was not put to the board and
19 rejected, but if they wanted to see a case like that
20 they could have asked for it.

21 Q. Let me understand that answer. Was
22 such a case developed to put to the board or to be
23 available to be put to the board? You have told us I
24 think through Mr. Mark no.

25 A. That's correct.

1 Q. And Case 23 I take the same answer
2 applies, no?

3 A. That is correct.
4 [12:20 p.m.]

5 Q. And your answer tells us, I assume,
6 that that was done because you knew what the Board
7 wanted to see?

8 MR. SHALABY: A. Mr. Heintzman, if I may
9 interject for a minute, if nothing else to give Mr.
10 Snelson a break... [Laughter]

11 Q. I would just as soon talk to you for
12 a moment, too, Mr. Shalaby.

13 A. We have a deal if anybody goes for
14 more than 20 minutes the other will cut in.

15 I think you are asking, what will the
16 shape of the Ontario electricity system be if we adopt
17 a philosophy similar to 23, 22 or 24, and I am
18 convinced that the documents that we have presented,
19 Exhibit 3, Exhibit 6, and all the others, contain that
20 intelligence, contain that information.

21 You correctly observed that the
22 requirements under median today are similar to
23 requirements under lower for the DSP, 1989.

24 If one wants to understand what would the
25 future look like under an all nuclear scenario you can

1 go to Plan 23 under lower load forecast and look at
2 emissions and look at costs and look at Ontario
3 content.

4 Now, there are modifications, there are
5 changes that have occurred, so you directionally can
6 adjust those results in your mind.

7 For example, if you look at cost
8 differential, Mr. Snelson has said that the cost
9 advantage of nuclear over fossil has narrowed, so you
10 can look at the cost differential and decide that it is
11 not as favourable or is more favourable or adjust it
12 mentally to get the information you want.

13 The point I am making is that we don't
14 need to redo everything to understand the implications
15 of it. The foundation is here, the work that we have
16 done, we can continue to draw on it, and to conclude
17 what needs further doing and what needs just referring
18 back to.

19 Q. Right.

20 A. So that is the answer I would like to
21 put on the record.

22 Q. You have put the nail on the head,
23 Mr. Shalaby, because what you are really saying is, we
24 don't need the Update to make the fundamental choices
25 that are already set out in the DSP between the

1 philosophy in Case 22, 23, 15, 24 and 26.

2 A. We can with the information that we
3 have prepared before make considerable judgments and
4 answer considerable questions as to what the future
5 would look like if we went this way or the other way.

6 Q. Yes, as long as we have got the
7 up-to-date information and as long as we have got those
8 philosophic choices before us we can make those
9 choices. That is what you are saying; right?

10 A. I am even saying more than that. I
11 am saying without having an Update you can look at
12 lower cases--

13 Q. Yes.

14 A. --take in the updates that were given
15 on costs and advantages and so on, and that you would
16 be very close to understanding what the future would
17 look like if you went all nuclear.

18 Q. Well, that is going to be a large
19 part of my cross-examination, that you can take Case
20 15, and indeed it is a much better tool than the
21 Update, and you can apply it to the present
22 circumstances and make your judgment, can't you.

23 A. Well, let's wait for your cross-
24 examination.

25 Q. That is what you are telling us,

1 isn't it.

2 A. I am saying that for the cases we
3 haven't analyzed that would be a very good proxy.

4 If we have made an Update, an analysis,
5 perhaps that would be even better than going on old
6 information. If I didn't make an Update, yes, I am
7 prepared to go on Plan 15 and answer a lot of your
8 questions.

9 Q. What you are telling us by your
10 interjection is that we can take Plan 15, which is on
11 the lower case almost identical to the Update, and make
12 our choices based upon the different philosophies
13 presented?

14 A. Draw a lot of conclusions.

15 Q. Yes.

16 A. If you want to call that making
17 choices, that is fine.

18 Q. But we can't do it if someone tries
19 to take those choices off the table, can we.

20 A. Maybe you can explain to me what
21 choices you are talking about.

22 Q. If someone says those choices are no
23 longer available, one of them let's say or two of them,
24 then you can't make that choice, can you?

25 A. I think Mr. Snelson went over and

1 over that we are not making a choice, period. So the
2 menu is on the table --

3 Q. You just interjected to say that you
4 can make those choices.

5 A. We can make judgments and we can
6 explain to you what the environment would look like, we
7 can explain to you what costs would be like, we can use
8 the older information to make an awful lot of judgments
9 about what the situation will be if we analyze a case
10 like that or if we decided to go that route.

11 Q. So as long as we have the up-to-date
12 information and the philosophic choices before us we
13 can make the same choice or the same choice process as
14 the Update makes, can't we, as long as we have got the
15 up-to-date information? Do you see any reason we
16 can't?

17 A. I am trying to review your question
18 in my mind again. Can you say it again?

19 Q. Well, you interjected to say, look,
20 we have got all this information, we can make the
21 choice; right?

22 A. We can provide an understanding, we
23 can answer questions about what happens if we went to
24 all nuclear, what happens if we went part this, part
25 that.

1 Q. Yes.

2 A. If you call that making choices for
3 the purpose of this discussion, that is fine. I don't
4 see choices in providing an understanding. But if you
5 see choices in that, that is fine.

6 Q. So you are agreeing with me? As long
7 as we have the philosophic cases there, we have the
8 up-to-date information, we can perform the same
9 exercise without the Update; right?

10 A. We will try and help you with that,
11 yes.

12 Q. Now, let's take the second point that
13 arises from your interjection, Mr. Shalaby. The second
14 point that arises from your objection is that you can
15 actually compare the Update --

16 A. I wasn't objecting. I was trying to
17 be helpful. Don't characterize my --

18 Q. No, your interjection, which has been
19 extremely helpful. [Laughter]

20 The second thing we can do, and we will
21 get to --

22 THE CHAIRMAN: You are going to spoil his
23 lunch if you keep that up. [Laughter]

24 MR. HEINTZMAN: Well, I need somebody to
25 spend 20 minutes with.

1 Q. The second thing we can do is we can
2 compare, to the extent that it is different, the Update
3 to Case 15, can't we?

4 MR. SHALABY: A. No, those comparisons
5 are not straightforward. I think what I am --

6 Q. We can do it, can't we?

7 A. What I am saying, to recap again, is
8 that we have updated certain information and that is
9 the quality information that is higher in resolution
10 than the older information, but where we have not
11 updated we can look at the older information and get an
12 awful lot of the philosophy or direction.

13 Q. Right.

14 A. So what I am saying is, when we have
15 an Update, that is reliable and that is the information
16 we should be looking at. When we don't have an Update
17 what I am saying is we don't have a void; we have
18 Exhibit 3 to look at, and that gives us a large number
19 of answers.

20 Q. Yes?

21 A. But I would not propose that we
22 ignore the Update and look at Plan 15. That simply
23 would not serve the purpose of the Update.

24 Q. Let's not ignore it for a moment.
25 Let's compare it. One of the things we can do is we

1 can compare the Update to Plan 15, can't we.

2 A. There are a lot of things that have
3 changed that make that direct comparison difficult.

4 Now, there are comparisons in philosophy
5 that are easy to make, there are comparisons in general
6 direction that are possible to make, but, for example,
7 if you want to compare present cost or present value
8 cost or things after that nature... So many things
9 have changed that make that direct comparison less
10 meaningful.

11 Q. But we can do it, making the
12 appropriate adjustments to Case 15, and then compare
13 that to the Update Exhibit 452, can't we.

14 A. There are many, many attributes that
15 we looked at: cost, performance in the various
16 environmental areas.

17 Now, it depends. What is it you want to
18 compare? Let's narrow it down. What is it you want to
19 compare and see if it is reasonable or not.

20 Q. We have got ingredients in the
21 Update, and I was going to come to this later in the
22 examination, but you have raised...

23 There is more demand management in the
24 Update than in Plan 15; right?

25 A. Yes.

1 Q. There is more NUGs in the Update than
2 in Plan 15?

3 A. Yes.

4 Q. There is life extensions in the
5 Update and they are not in Plan 15?

6 A. Yes.

7 Q. There is no new generation in the
8 Update and there is new generation in Plan 15?

9 A. There is new generation in both of
10 them. There are different sets of approvals requested,
11 if that is what you are --

12 Q. Well, all right. Those are
13 differences between those two cases?

14 A. That is correct.

15 Q. You can compare those two cases?

16 A. We can identify those differences,
17 yes.

18 Q. And then we can compare them, the
19 criteria?

20 A. With limitations. I don't want to
21 get into a prolonged debate other than to say there are
22 things that are more easy to compare, there are other
23 things that are more difficult to compare.

24 Q. But that is the plan again, that is
25 the assessment process, isn't it?

1 A. Yes.

2 Q. Now, there is nothing in the Update,
3 there is not one page in the Update that compares this
4 plan with Case 15, is there?

5 A. Not to my knowledge.

6 Q. Or with Case 22?

7 A. Not to my knowledge.

8 Q. Or to Case 23.

9 A. Same answer.

10 Q. Yes.

11 A. That was not the purpose of the
12 Update, is to compare to the older generation of plans.

13 It was to provide our board of directors
14 and provide this Board of Inquiry with the latest views
15 that Ontario Hydro has about meeting our customer
16 demands into the future according to all the criteria
17 that we mentioned.

18 Q. But some may find it deficient
19 because it doesn't do the very thing it is required to
20 do; that is, compare an alternative way of
21 accomplishing what is in Exhibit 452. This document
22 just doesn't contain that, does it.

23 A. It contains three plans, as all my
24 colleagues and myself introduced in this panel. It
25 contains comparisons that we feel are more appropriate

1 today than the cases that we formulated three or four
2 years ago.

3 Q. I am going to come back to this. The
4 things that it compares are things that it is not
5 asking this Board to consider; right?

6 A. It provides a context in which to
7 consider the approvals that we are requesting.

8 Q. No, the three things that it
9 compares - the nuclear case, the fossil case and the
10 enhanced case - you are not asking for approvals on?

11 A. That's correct.

12 Q. So the three things that it does
13 compare you are not asking this Board to consider;
14 right?

15 A. We are not asking approvals on.

16 Q. Yes. And the things that it doesn't
17 compare - the Manitoba Purchase, the fossil extensions,
18 those sort of things - it doesn't compare it to
19 anything, does it - this document, 452?

20 A. If you are saying we have not
21 formulated plans that do not have Manitoba or plans
22 that do not have life extensions--

23 Q. Yes.

24 A. --in that document, you are correct.

25 Q. Yes. And even as to the NUG and DM

1 components of this 452, it doesn't compare those to the
2 pre-existing NUG and DM plans, does it, and say: Which
3 is better?

4 A. It doesn't show plans that have fewer
5 NUGs and fewer demand management, but I think you can
6 draw the conclusion as to which is better.

7 Q. Well, this document doesn't compare
8 the old NUG to the new NUG, the old DM to the new DM
9 plan, does it.

10 A. This document does not, but it
11 indicates that the demand management and the NUGs are
12 below avoided cost, and we know from what we told this
13 Inquiry and what we have worked on for years that if
14 you have an option that is cheaper than another option
15 that is a better way to go.

16 So you don't need to do the mechanics and
17 the numbers to know it is a better option. You know it
18 is lower than avoided cost; that is the way you should
19 go.

20 Q. Well, it may be that you are right,
21 but this document doesn't analyze the environmental,
22 the social, the cost, and all the other criteria of the
23 old demand management plan to the new demand management
24 plan, does it.

25 A. The answer is: Yes, it does not.

1 Q. Thank you.

2 A. And the subtitles are: We didn't
3 think it was useful or necessary to do that, to compare
4 a plan with larger demand management to a plan with
5 smaller demand management.

6 We know directionally that the more
7 demand management we can get below avoided cost the
8 more consistent that will be with our priority
9 strategic directions and for that reason we selected
10 that plan.

11 MR. SNELSON: A. And Exhibit 452 does
12 reinforce those priority strategic directions. They
13 are explicitly included in Exhibit 452.

14 Q. Well, this is a point I was going to
15 come to much later in my examination. That is, you
16 have set up a priority, Mr. Snelson. And I guess Mr.
17 Shalaby's 20 minutes was up so we will come back to
18 you. You set up a system of priorities for demand
19 management and NUGs; right?

20 A. Effectively, yes.

21 Q. Yes. So in every one of these plans
22 we are going to go through you don't compare meeting
23 the electricity requirements of Ontario citizens by
24 virtue of demand management to some other method or
25 alternative, do you, because you have made it a

1 priority?

2 A. In our plans we have not done so, but
3 we have in terms of our general consideration of the
4 options.

5 Q. Well, in the plan, in this document,
6 Exhibit 3, or in Exhibit 452, you don't set out to
7 analyze and establish the criteria and go through the
8 societal, economic, environmental, and all the other
9 things that we know and love so well of the demand
10 management way of meeting the requirements of Ontario
11 citizens as opposed to doing it in some other way, do
12 you. You have just set it as a priority.

13 A. We have described the environmental
14 and social implications of the demand management and
15 non-utility generation options in documents such as
16 Exhibit 4.

17 Q. So I want an answer to the question.
18 If you turn to page A2 --

19 THE CHAIRMAN: They didn't do it in
20 Exhibit 3 either.

21 MR. HEINTZMAN: Exactly. Exactly.

22 THE CHAIRMAN: So I mean, I took it this
23 was a different, you were focussing on the difference
24 between the Update and Exhibit 3 and it wasn't done in
25 Exhibit 3 either.

1 MR. HEINTZMAN: Q. On this point we have
2 the same attribute.

3 MR. SHALABY: A. Mr. Heintzman, there is
4 a generation of plans that precedes even Exhibit 3, Mr.
5 Chairman, and that is the illustrative plans we
6 analyzed in the mid-to-late-80s, and those are provided
7 to this Board as exhibits that looked at, for example,
8 an all supply case versus an all demand case.

9 And those cases are documented here, and
10 those showed us that a mix of supply and demand was a
11 more desirable mix to go through.

12 So I am saying that 452 builds on Exhibit
13 3; Exhibit 3 builds on what went before it. We don't
14 make it a habit to repeat everything from day one every
15 time our data changes. We learn and retain that
16 knowledge and build on it.

17 Q. Let's understand what exactly went on
18 in your planning process.

19 If you turn to Exhibit 3, Appendix A,
20 A-1, paragraphs 2 and 3 say that Ontario Hydro is
21 giving priority to demand management in paragraph 2 and
22 non-utility generation in paragraph 3; right?

23 MR. SNELSON: A. Yes.

24 Q. So that in every one of the plans
25 that we examine in Exhibit 3 and in Exhibit 452 they

1 all have at the top, coming off the top, demand
2 management and NUGs; right?

3 A. That is correct. And these
4 priorities are based upon the Demand/Supply Planning
5 strategy, which as Mr. Shalaby has said included
6 analysis of plans with different mixes and was based on
7 a very extensive public consultation, consultation with
8 Select Committees of the government, where these sorts
9 of priority directions were confirmed.

10 Q. Right. Well, what happened? If you
11 go back, and I think you have told us this but just to
12 reflect on it, what happened was that prior to 1989 you
13 had in process a planning approach that considered
14 whether you should have demand management, NUGs and all
15 sorts of ingredients in the plan, and that was the sort
16 of philosophy at that time, but starting with this
17 document in March of 1989 the DSPS said: No, from now
18 on we are going to put at the top of the list demand
19 management and NUGs. That is the historical way this
20 unfolded?

21 A. Certainly, the priority for demand
22 management and NUGs was enunciated in the Demand/Supply
23 Planning Strategy in 1989, and, as I have said, that
24 was based on a lot of planning studies and a lot of
25 consultation activities with public and with the

1 Legislature.

2 Q. But before that - and we can go back
3 and look at some of the exhibits if we have to - the
4 approach that Hydro was developing was: No, these
5 various programs have to be considered on their own
6 merit, one against the other, and we will determine on
7 their merits which one should be adopted and to what
8 extent; that's correct?

9 A. I'm not sure, before when.

10 Q. Before March of 1989.

11 A. Yes?

12 Q. And then in March of 1989 you adopted
13 a different planning philosophy where you said: From
14 here on in demand management and non-utility generation
15 are on a different plane; they are prioritized. Right?

16 MR. SHALABY: A. Provided that they are
17 implemented in ways that are acceptable, at costs that
18 are competitive, and many other conditions. It is not
19 as dogmatic as you make it sound.

20 Q. Okay. But they were prioritized to
21 that extent?

22 A. Yes.

23 Q. Right. And they from there on were
24 not compared to other alternative means of meeting the
25 electricity requirements of the citizens of Ontario?

1 A. No, they continually get compared in
2 what we describe as closing the loop. Closing the loop
3 means is the component that is demand management or the
4 component that is non-utility generation still leading
5 to a low cost plan, is it still a lower component in
6 cost than other options. We compare it to avoided
7 costs all the time, and it meets that test.

8 Q. Well, it meets the test of avoided
9 cost --

10 A. And we look at environmental
11 considerations, and it continues to meet the
12 environmental advantages that in the first place
13 resulted in those priorities.

14 So it isn't that it found itself on a
15 different track and forever stayed on that track
16 without any reference to other options --

17 Q. Well, when I look at the plans they
18 come right off the top.

19 [12:40 p.m.]

20 The first thing that comes off is demand
21 management and the next thing that comes off is
22 non-utility generation.

23 A. Yes.

24 Q. But then at the end we check whether
25 that was an appropriate thing to do.

1 Q. All right. But in the going-through
2 process you don't at any point compare demand
3 management and non-utility generation with another way
4 of accomplishing the same result; namely, meeting the
5 electricity requirements of Ontario citizens; do you?

6 MR. SNELSON: A. The plans all have in
7 the demand management and non-utility generation, but
8 that's only one sort of comparison that we do.

9 We have discussed through nine panels the
10 detailed characteristics of individual options, well,
11 the individual options were against panels 4 through 9.
12 And those discussions have been in terms of the merits
13 of the options. We have talked about the environmental
14 characteristics of demand management, we have talked
15 about the costs, we have talked about the social
16 impacts and so on. And that's true of much of the
17 documentation.

18 So there are comparisons of demand
19 management and non-utility generation on a variety of
20 factors.

21 Q. Well, Mr. Snelson, I have read
22 Exhibit 3 and I have listened to a great deal of
23 testimony, I can't find any place where you say, here
24 is the amount of demand management and now let's look
25 at satisfying that electrical requirement by fossil

1 generation or nuclear generation.

2 Can you point to me somewhere where you
3 make that comparison?

4 MS. HOWES: A. I think I can.

5 Q. All right.

6 A. If you refer to Exhibit 4.

7 Q. I don't have Exhibit 4 here.

8 A. 4-1. The right-hand column of that
9 page, the second full paragraph down that begins that
10 "Environmental characteristics of demand management",
11 and I will refer to the last sentence in that
12 paragraph:

13 Preliminary of estimate of these
14 effects - which is referring to demand
15 side management - indicate that they are
16 negligible when compared to the effects
17 of producing the displaced power through
18 conventional generation.

19 And I would agree that in - was it -
20 Panel 4, the demand management panel, there was a
21 discussion of the environmental implications of demand
22 side management against fossil.

23 Q. But I agree that there is a
24 discussion of the environmental effects of demand
25 management, but the demand management component there

1 being spoken of is a constant in every one of the cases
2 put forward; is that not correct?

3 MR. SHALABY: A. There were discussions
4 of environmental effects if demand management was not
5 there. We provided as exhibits to this hearing what
6 the environmental implications would be if you pulled
7 out the demand management component and replaced it
8 with supply. That report is on the table and we are
9 looking for it here.

10 Q. But in every one of the cases put
11 forward to the Board, whether it's in Exhibit 3 or
12 Exhibit 452, the demand management is a constant
13 element?

14 A. Yes. And the reason for that is, we
15 were not trying to be putting a random sort of
16 selection of plans, we were putting plans that we feel
17 are targeting our priorities strategic directions, are
18 consistent with them, because we know that is the
19 direction we want to go through.

20 If we put a plan without demand
21 management we know at the end of the day we will reject
22 it. Why take people through a long course of
23 description and work and then at the end we know fully
24 that that plan will not fare as well. We know that.
25 The costs will be higher, the environmental impacts

1 will be higher, the social acceptance and acceptability
2 in the Ontario community would be lower, why bother
3 formulating a plan like that and presenting it.

4 Q. We will get to the why bother later,
5 Mr. Shalaby, but in fact no such plan has been put
6 forward to this Board?

7 A. It's been put forward in the 1986,
8 '87, '88 documents. We have done that when we have
9 wondered whether it is or is not a good idea, and once
10 we are convinced it's a good idea we will build on it.

11 Q. So from 1989 forward and before this
12 Board Hydro has not put forward a case or plan which we
13 can compare to where you either eliminate or diminish
14 demand management so we can have a comparison of those
15 two methods?

16 A. The answer is we have on the record
17 plans that do not have demand management.

18 Q. Prior to 1989?

19 A. Yes, prior to 1989.

20 Q. But those plans are not here before
21 this Board for approval?

22 A. They are before this Board for
23 information and for providing the sort of the basis on
24 which we built our strategy and the basis on which we
25 decided demand management is a priority. They are

1 before this Board. I don't see why you keep saying
2 that.

3 MR. SNELSON: A. And Mr. Shalaby did
4 indicate that in Panel 4 we put forward plans without
5 demand management post '89.

6 Q. Well, there is no such plan contained
7 in Exhibit 3 or Exhibit 452. You will agree with that.

8 A. That's correct. They are two of the
9 large number of exhibits in front of this Board.

10 Q. And there is no such plan proposing
11 an alternative method of that nature, i.e., eliminating
12 or are reducing NUGs in either Exhibit 452 or Exhibit
13 3; correct?

14 A. That is correct.

15 Q. Now, I want to turn then to the
16 enhanced case under the Update, which you will find on
17 page 32 and 33 of Exhibit 682. As I understand this
18 case, it was primarily designed to reduce SO(2), CO(2),
19 NOx and acid gases. Is that a fair statement to
20 whomever should respond?

21 MS. HOWES: A. It also looked at wastes
22 as well and it looked at some options for supply that
23 were not nuclear or fossil.

24 Q. Yes, all right. But do I understand
25 from the evidence that the primary thrust of it,

1 though, was to -- and I would assume the primary cost
2 element in the enhanced case is to address SO(2),
3 CO(2), NOx and acid gas considerations?

4 A. I cannot refer to the costs because
5 my expertise is environmental, but from an
6 environmental point of view I was looking, or we were
7 considering, a range of environmental effects,
8 emissions were one, wastes were another, options for
9 supply were a third.

10 Q. Can you give me any idea on a cost
11 basis what percentage of the enhanced case is
12 attributable to dealing with those gases I am referring
13 to?

14 MR. DALZIEL: A. The costs of the
15 enhanced case are described in Exhibit 646 under
16 attachment C, the very last page of that attachment is
17 C3-12.

18 Q. Yes?

19 A. You were asking about costs of
20 emission controls?

21 Q. Yes.

22 A. The second category is emission
23 controls and other costs for existing generation.

24 Q. Right. I would just like to get an
25 idea of what percentage of that amount of 4,668,000,000

1 in 1992 dollars, is that the number we are looking at?

2 A. It's a present value cost 1992
3 dollars, yes.

4 Q. What percentage of that is directed
5 towards the kind of emissions I have been referring to?

6 I assumed from the description I read in
7 the transcript that it was the overwhelming proportion
8 of the cost of that plan in terms of the environmental
9 assessment aspects of it.

10 A. I don't have the details of what
11 percentage was attributed to SO(2), NOx, the acid
12 gases. Are those the ones that you are mentioning?

13 Some of those emission controls were for
14 different ways of reducing particulate, for example.

15 Q. Particulates from fossil stations?

16 A. Yes. They also included costs for
17 MISA at all stations.

18 Q. And again applicable to fossil
19 stations?

20 A. And nuclear stations.

21 Q. That was my question. What amount of
22 that \$4.7 billion is attributable to fossil stations as
23 opposed to nuclear stations?

24 A. I don't have that information with
25 me.

1 Q. Can you find that out for me?

2 A. I can look into it.

3 MR. HEINTZMAN: Thank you.

4 Could I have an undertaking for that, Mr.
5 Chairman?

6 THE REGISTRAR: 684.16.

7 ---UNDERTAKING NO. 684.16: Ontario Hydro undertakes to
8 provide amount of \$4.7 billion is
9 attributable to fossil stations as
opposed to nuclear stations, page 32 and
33 of Exhibit 682.

10 MR. HEINTZMAN: Q. I understood from the
11 transcript and the references at Volume 149, page
12 26325, and I don't think you have to look it up, Ms.
13 Howes, but I think you said at that point that to the
14 extent that it contained nuclear upgrades, if I can use
15 that word, those were already under way as I understood
16 your evidence. You may want to look at page 26325.

17 MS. HOWES: A. Yes, I think the point
18 that I was making, some of those upgrades are under way
19 at one station, and we assumed for this particular case
20 that all of those upgrades would occur at all of those
21 stations and there was some costs incurred for those
22 updates to be - I'm going to use the word - "installed"
23 at all of the stations.

24 Q. Again the impression from what you
25 said, that this - if I can use the word - upgrade is

1 already part of Ontario Hydro's --

2 A. It may be under way at one station,
3 it is not intended at this time to be under way at all
4 stations.

5 For the enhanced plan we assumed that the
6 upgrades would be done at all stations.

7 Q. So that in the number you are going
8 to give to me, you will exclude from the nuclear
9 enhancement any enhancements that are already in your
10 operating --

11 A. Absolutely.

12 Q. Okay. Now, this case, this enhanced
13 case, and Ms. Howes, can you give me even an idea as to
14 whether -- that the largest portion of the emission
15 controls, et cetera, of this \$4.7 billion would be
16 related to fossil stations and not to nuclear stations;
17 would that be a fair statement?

18 A. Wouldn't you rather wait until we had
19 the results of the undertaking? I think that's what
20 the --

21 Q. You have no idea now?

22 A. At that point I don't know what the
23 percentage difference between the fossil and nuclear
24 would be at this point.

25 Q. But you have rhymed for us in the

1 evidence all of the components of it. And except for
2 that reference to the nuclear on that one page, all of
3 the rest of it, as I understood it, related to fossil?

4 A. There were MISA upgrades as Mr.
5 Dalziel mentioned, and there were -- I forget what the
6 other ones were at this point. But subject to
7 confirmation from the undertaking that Mr. Dalziel has,
8 I can agree that, yes, likely many of those costs were
9 for the fossil system.

10 Q. That the largest proportion of it
11 would be for the fossil system?

12 A. Could I say large at this point
13 subject to the clarification from Mr. Dalziel's
14 undertaking?

15 Q. Yes.

16 A. Fine.

17 Q. What I am suggesting to you, though,
18 and again whoever who should answer this, the enhanced
19 case is based on a fossil case?

20 A. Much of the base load for the
21 enhanced plan is IGCC. The fuel for the fuel cells is
22 indeed natural gas, the fuel for the biomass
23 plantations is wood, wood waste.

24 Q. Well, if we look at page 33 of
25 Exhibit 682, under the enhanced column, except for the

1 fuel cells and biomass which I will come to, all of the
2 other generation is fossil generation and none of it is
3 nuclear?

4 A. That is correct.

5 Q. So that if you were intending to
6 design an enhanced case and if you were intending to
7 apply it in order to reduce SO(2) and NOx and acid gas
8 and everything, I have a great deal of difficulty
9 understanding why you wouldn't apply the enhanced case
10 to a nuclear-based case rather than to a fossil-based
11 case?

12 A. I think my evidence suggests that the
13 enhanced plan has better performance from SO(2) and a
14 NOx perspective.

15 Q. Than?

16 A. The update nuclear case.

17 Q. Exactly. But if you had taken the
18 enhanced case and applied it to a nuclear-based case;
19 in other words, what you did, if you look on page 33,
20 you applied the enhanced case to the fossil case which
21 is in the middle of the case. If you had taken the
22 enhanced case and applied it to the nuclear case on the
23 left-hand column side, all of these charts for the
24 enhanced case, SO(2), NOx, whatnot, would have been
25 dramatically lower than these charts show for the

1 enhanced case?

2 A. They could probably have been for
3 those emissions. They may well have been considerably
4 higher for other wastes or emissions.

5 Q. But if, as I understood, the thrust
6 of your evidence, and you went on at a great lengths
7 about all of the additions of the enhanced case to the
8 fossil plants, if the thrust of it is to reduce those
9 acid gases and air emissions, you will agree with me
10 that your enhanced case is going to be a much more
11 enhanced case if it's a nuclear-enhanced case than a
12 fossil-enhanced case?

13 A. I am not sure I can make that
14 judgment without having looked at all of the emissions
15 and wastes that we considered in that particular plan.

16 It is true that this is an illustrious --
17 illustrious, maybe it is -- an illustrative case, and
18 there could be others.

19 Q. But when you have got two cases on
20 the page on the left-hand side and your object is to
21 fairly present what an enhanced case will look like in
22 terms of SO(2), NOx, et cetera, why did you not run an
23 enhanced nuclear case? Can you explain that to me.

24 A. We probably could have run an
25 enhanced with a nuclear base. But I am suggesting that

1 in my direct evidence we got considerably better
2 performance from the enhanced case from the emissions
3 that you were describing in the earlier period before
4 2010.

5 Q. But you didn't look at what you would
6 get if you ran an enhanced nuclear case; did you?

7 MR. DALZIEL: A. An enhanced case
8 applied to a nuclear case up to the year 2010 would in
9 all probability would be much the same as what is shown
10 here. After that period there definitely would be some
11 differences.

12 And building on what Mr. Shalaby has said
13 about Exhibit 3, we can take some of the information
14 that we provided here and directionally you can make
15 judgments as to where certain emissions are going to
16 go.

17 Q. Well, I have a difficulty with that,
18 because the enhanced case involves applying all of
19 these devices to not only the existing system, but to
20 new generation; right?

21 MS. HOWES: A. No. The new generation,
22 the IGCC we assumed an SCR, it would not require
23 scrubbers and the other technologies that we assumed.

24 Q. Well, it assumes application of the
25 enhancement to the total plan including the existing

1 plan, right? I don't know whether your enhancements
2 are on the new fossil generation, but they are
3 certainly on the existing.

4 A. That's true. And I stated that we
5 assume state-of-the-art for the CTU combined-cycle, and
6 we have assume that the IGCC in the enhanced plan would
7 have SCR for better NOx control.

8 MR. DALZIEL: A. And some of the new
9 generation would have common requirements with respect
10 to MISA, for example.

11 [1:00 p.m.]

12 Q. Yes, but if you look, for instance,
13 at page 43 of Exhibit 682 I would assume you got the
14 update enhanced NOx emissions, say, in 1999. If you
15 apply the enhancement to a nuclear system your NOx
16 index is going to be at least as low as the update
17 enhanced.

18 MR. B. CAMPBELL: Mr. Heintzman, I'm
19 sorry, I don't understand the question. There is no
20 new generation in the cases until about 2009, 2010.
21 What do you mean when you say if you apply in 1999
22 enhancements to the nuclear system? I just don't
23 understand. We don't have new generation coming in. I
24 don't understand what you are talking about.

25 MR. HEINTZMAN: Q. Well, you are

1 applying the enhancements to three systems that are set
2 forth on the bottom of the page. The one on the left
3 is the update nuclear, the next is the update fossil,
4 and those lines are considerably higher than the line
5 of update enhanced; right?

6 MS. HOWES: A. Yes.

7 Q. If you had run a case and if you
8 build your system with an enhanced nuclear case and an
9 enhanced nuclear system, the NOx emissions will be at
10 least as low as what you have shown for the update
11 enhanced?

12 MR. B. CAMPBELL: In what period are you
13 talking, please, because the question just doesn't make
14 any sense unless you put some time on it.

15 THE CHAIRMAN: You have got another line
16 I assume with another symbol showing Update nuclear
17 enhanced, and that line would at least be -- since Mr.
18 Heintzman has suggested to these witnesses, that line
19 would at least be as low as the current update
20 enhanced, starting back in '92 and going forward from
21 there.

22 MR. B. CAMPBELL: If you put all the same
23 things that are in the current update enhanced on the
24 existing --

25 THE CHAIRMAN: The problem with me is I

1 don't know how you create an update nuclear enhanced,
2 but I suggest we will find out about that later on.

3 MR. B. CAMPBELL: I am trying to get my
4 friend to clarify what he is talking about because I
5 don't understand when we are dealing with the existing
6 system and emissions from the existing system what he
7 is talking about. If he is talking about --

8 THE CHAIRMAN: Someone has plotted a line
9 there, Mr. Campbell.

10 MR. HEINTZMAN: Yes.

11 THE CHAIRMAN: Someone has plotted a line
12 that shows what the update enhanced will do, and it
13 shows it will reduce the NOx emissions considerably
14 from '92 through to the year 2000.

15 MR. B. CAMPBELL: Absolutely. And as I
16 understand the question, it is asking what would happen
17 if you applied something to some other case.

18 DR. CONNELL: Isn't it going back to 646,
19 page C3-12? Isn't it spending that four billion, six
20 hundred and sixty-eight thousand dollars on emissions
21 controls and other costs for existing generation?
22 Isn't that what Mr. Heintzman is getting at?

23 MS. HOWES: Existing generation, you mean
24 existing nuclear generation?

25 MR. HEINTZMAN: No, on the existing

1 system as it --

2 THE CHAIRMAN: Fossil.

3 MR. HEINTZMAN: Q. On page 43 you have
4 plotted three systems as they go out into the future;
5 right?

6 MS. HOWES: A. Right.

7 Q. One is a system which has nuclear and
8 some fossil for peaking; right? One is a case that has
9 entire fossil. One is a case which has entire fossil
10 with enhancements as stated by you.

11 Now, my suggestion to you, if you apply
12 the same enhancements, the same requirements for
13 enhancements to the nuclear generation stations to the
14 extent they are there, to the fossil stations to the
15 extent they are there, that the NOx index line is going
16 to be at least at low as the line for the Update
17 enhanced? Is that not obvious?

18 MR. DALZIEL: A. I think I said earlier,
19 I answered that "yes". I said that in all likelihood
20 they would be exactly the same. It wouldn't just be
21 the NOx index. It would be all the indices up to that
22 point in time.

23 Q. All right. So that --

24 THE CHAIRMAN: Can we go to lunch now?

25 MR. HEINTZMAN: We certainly can.

1 THE REGISTRAR: Please come to order.

2 This hearing will adjourn until 2:30.

3 ---Luncheon recess at 1:05 p.m.

4 ---On resuming at 2:37 p.m.

5 THE REGISTRAR: Please come to order.

6 This hearing is again in session. Please be seated.

7 THE CHAIRMAN: Before we start I have
8 been asked to record yet another exhibit, No. 690,
9 filed by the proponent, Ontario Hydro, entitled:
10 Clarification Material on Exhibit 520.102
11 [Interrogatory 9.2.44], Regarding the Pickering Payback
12 Cost Details.

13 I have said before, when we end this
14 hearing we will probably speak in nothing but numbers.

15 ---EXHIBIT NO. 690: Filed by the proponent, Ontario
16 Hydro, entitled: Clarification Material
17 on Exhibit 520.102 [Interrogatory
9.2.44], Regarding the Pickering Payback
Cost Details.

18 THE CHAIRMAN: Mr. Heintzman?

19 MR. HEINTZMAN: Thank you, Mr. Chairman.

20 Q. Ms. Howes, Mr. Shalaby and Mr.

21 Snelson, I guess the three of us were talking about
22 page 43 of Exhibit 682 which tracks the NOx being
23 emitted by a generating system, being either the update
24 nuclear so-called update fossil or update enhanced, and
25 I think you had agreed, Ms. Howes, that if the system

1 is an enhanced nuclear system that the emissions will
2 be at least as low as the line there shown for the
3 update enhanced?

4 MS. HOWES: A. Yes. I think Mr. Dalziel
5 answered that for me.

6 Q. Thank you, Mr. Dalziel.

7 If we turn to page 47 we have a situation
8 where we are tracking emissions, and again, now, we
9 have the update nuclear so-called line below, and would
10 you agree with me that the update enhanced nuclear
11 case, if it had been run, would have a line at least as
12 low as the update nuclear line?

13 A. Beyond the year 2010? Yes.

14 Q. I'm sorry?

15 A. Yes.

16 Q. And in any of the years--

17 A. Preceding?

18 Q. --shown there?

19 MR. SHALABY: A. Did you mean update
20 enhanced?

21 Q. Update enhanced, if it was on a
22 nuclear base, yes. You are agreeing with me?

23 A. I think you said at least as low as
24 update nuclear. I thought you meant at least as low as
25 update enhanced.

1 Q. No, at least as low as update
2 nuclear.

3 A. Oh.

4 Q. The update nuclear line is now lower
5 than either the update fossil or the update enhanced,
6 and I am suggesting to you that now we have a situation
7 which I am trying to demonstrate you are getting the
8 best of both worlds here; you are getting now, I
9 suggest, at least as low particulate emissions as the
10 update nuclear line; right?

11 MS. HOWES: A. Right. Could we just
12 clarify again what we are talking about? What are you
13 phrasing this? You are phrasing this as: update
14 enhanced nuclear?

15 Q. Yes.

16 A. And that would be...? If could you
17 just clarify what exactly that --

18 Q. Go back to page 33?

19 A. Yes? It's long time since the break.
20 Yes?

21 Q. Taking the plan on the left-hand
22 side--

23 A. Yes.

24 Q. --the so-called nuclear plan--

25 A. Yes.

1 Q. --and applying to it the
2 environmental enhancements where they would be
3 applied--

4 A. Yes?

5 Q. --that are inherent in your enhanced
6 plan on the right, which you have told me, and we can
7 see, only has fossil units for the new units and, of
8 course, we are going to apply them to the existing
9 system as well, and most particularly to the existing
10 system.

11 DR. CONNELL: Sorry, Mr. Heintzman. I
12 believe you have misrepresented the figure on page 47.
13 As I read it, up until 2009 the nuclear is not the
14 lowest line. After 2009 it appears to be the lowest
15 line.

16 MR. HEINTZMAN: Yes, exactly.

17 DR. CONNELL: Before 2009 it tracks the
18 fossil line.

19 MR. HEINTZMAN: Q. Yes. So I guess I
20 was -- you are absolutely right. I was focussing on
21 the end of the chart.

22 So from the year 2010 to 2017 the
23 particulate emission would be -- if we had an update
24 nuclear-enhanced case, it would be at least as low as
25 the update nuclear case therein shown after 2010?

1 MS. HOWES: A. It probably would be in
2 that range, but there would probably still be some
3 particulates associated with the alternative
4 technologies that are in there. That is why I wanted
5 to go back to 33 to find out exactly what you were
6 meaning by your case.

7 Q. That is a good point. So you are
8 saying if we put the fuel cells and the biomass into
9 the nuclear case and keep the nuclear to 6.0 -- and
10 readjust the nuclear? I was assuming that, I must say.

11 A. Right.

12 THE CHAIRMAN: I think you can only
13 perhaps deal with this in very general terms--

14 MS. HOWES: I agree.

15 THE CHAIRMAN: --because if you enhance
16 the nuclear plan adopting the same general principles
17 that you adopted in enhancing the fossil plan, you
18 wouldn't -- or will you? You wouldn't do it in quite
19 the same way?

20 MS. HOWES: No, probably not.

21 THE CHAIRMAN: But you could enhance --
22 in general terms, there is no reason why you couldn't
23 enhance the nuclear plan as you did the fossil plan?

24 MS. HOWES: That's correct.

25 THE CHAIRMAN: No bar to that?

1 MS. HOWES: No.

2 MR. HEINTZMAN: Q. And that is exactly
3 what I am trying to get at.

4 Generally speaking, and I appreciate that
5 there will be refinements, but if we look at page 47
6 that we would expect the update nuclear plan enhanced
7 to have particulate emissions after 2010 which are
8 generally speaking tracking the update nuclear line
9 there?

10 MS. HOWES: A. Generally speaking, yes.

11 Q. And similarly, and just looking at it
12 before 2010, you will agree with me that before 2010 we
13 should expect again with an update nuclear enhanced
14 plan for the particulate emissions to track the update
15 enhanced because we are getting the enhancement on the
16 particulate emissions?

17 A. Generally speaking, yes.

18 Q. And the same would be true if we turn
19 to page 49 for the CO(2)? Generally speaking, since we
20 are either out to about 2010 reducing CO(2) emissions
21 through enhanced environmental controls on the fossil
22 and after about 2010 we have lower emissions because of
23 nuclear that we are going to track generally speaking
24 the update enhanced line and then the nuclear line?

25 A. I would say beyond 2010 it probably

1 would be somewhere between the update enhanced and the
2 update nuclear line there. There was the addition of
3 fuel cells, if you remember, in this case. So it would
4 be somewhere between those two lines on the graph.

5 I think the other key thing to remember,
6 too, in the enhanced plan is there is slightly more
7 demand management and NUGs, so you would have to take
8 that account into your adjustment of these lines.

9 Q. Well, now, I want to then turn to
10 that, what you have just mentioned, and try to create a
11 level playing field, if I can, between the nuclear
12 enhanced plan and the other plans.

13 Now, first of all we have already noted
14 that the enhanced plan has about 8.6 gigawatts of
15 fossil instead of a comparable amount of 8.7 of
16 nuclear. So if that is the one difference between the
17 two plans, if we had an enhanced nuclear as to enhanced
18 fossil, we are going to have that much less fossil
19 generation in the plan, approximately?

20 THE CHAIRMAN: You are looking at page
21 33?

22 MR. HEINTZMAN: Q. Page 33. And we are
23 going to have to make some adjustment for what you put
24 in the fuel cells and biomass, but there is going to be
25 in the order of eight to nine less gigawatts of fossil

1 generation and that much more of nuclear generation?

2 The amount is not that important. There
3 is going to be some amount of fossil generation removed
4 and some amount of nuclear generation inserted?

5 MS. HOWES: A. That's right. That's
6 right.

7 Q. And if you just reflect back, Ms.
8 Howes and Mr. Snelson, on my discussion with you on the
9 absence of Plans 22 and 23 from this analysis, I
10 suggest to you what we are seeing here is a potentially
11 compounding effect. That is, if you put before us a
12 Plan 22 or 23, which has enhanced nuclear, over what
13 you have on the left-hand side of page 33 and you then
14 enhance it with the various environmental controls that
15 Ms. Howes has told us about, then we should expect a
16 compounding of the reduction of CO(2), NOx, acid gases
17 and those sort of things? Would you agree with that?

18 A. Generally, you would get lower SO(2),
19 lower CO(2), and lower NOx. You would probably get
20 higher radioactive waste and higher radionuclides.

21 Q. Yes. Right. Now, let's just go back
22 to the difference between the enhanced plan and the
23 nuclear and fossil plans, and you just commented on it,
24 Ms. Howes; that is, that the enhanced plan assumes no
25 reduction in demand management or NUGs, as I understand

1 it.

2 A. The surplus in the enhanced plan is
3 managed by mothballing fossil stations, and in the
4 other plans the surplus is managed by deferring some
5 NUGs.

6 Q. Right. So I am correct, am I, that
7 in the enhanced plan there is no assumed reduction or
8 management of demand management and NUGs?

9 A. That's correct.

10 Q. Right. And that automatically makes
11 the enhanced plan more expensive because -- and I think
12 you say it in your evidence, that it is about 10 to 15
13 per cent extra cost in the enhanced plan just because
14 you are maintaining a higher level of demand management
15 and NUGs?

16 MR. DALZIEL: A. I don't know that we
17 said it was 10 to 15 per cent more. It might work out
18 to be that. But we showed that not managing the
19 surplus is more costly. We showed that on page 71 of
20 Exhibit 682.

21 Q. Yes. Yes. Sorry, five to 10. If
22 you could look at page -- in Volume 149, at page 26384.

23 THE CHAIRMAN: Can you give me the page
24 number again, please?

25 MR. HEINTZMAN: 26384, Mr. Chairman, and

1 there are three pages actually, 26371 and 26369, if you
2 want to make a reference of that, where this point is
3 dealt with.

4 Q. 26384, 26371 and 26379 are all
5 commenting on the fact that the extra DM and NUGs is
6 going to add some cost to these plans.

7 On page 26371, was that you, Ms. Howes,
8 that is talking at that time, you say:

9 In present value terms there are
10 higher costs as a result of not reducing
11 demand management, the hydraulic, and the
12 purchase NUGs?

13 [2:50 p.m.]

14 MS. HOWES: A. Net present value words
15 would never be uttered from this mouth. Someone down
16 at that end. [Laughter]

17 Q. Someone told us that.

18 MR. B. CAMPBELL: Mr. Dalziel, I believe.

19 MR. DALZIEL: Which page, 26371?

20 MR. HEINTZMAN: Q. Yes. At about line
21 13.

22 MR. DALZIEL: A. Yes, that's correct.

23 Q. And on page 26384.

24 A. Yes. At this point Dr. Long is
25 talking.

1 Q. And the figure of 5- to 10 per cent
2 being added to the rates due to the increased targets
3 of demand management and NUGs are referred to there.

4 DR. LONG: A. Sorry, which page is that
5 on, 26384?

6 Q. Yes.

7 A. And here we are talking about the
8 enhanced plan?

9 Q. I understood it to be, but...

10 A. In the second paragraph there I talk
11 about rates being higher in the late 90s and the early
12 2000s by up to 10 per cent, but the reason cited is the
13 additional environmental controls and not demand
14 management.

15 Q. I see. I am looking at the bottom
16 the two lines, three lines. Increased targets for
17 demand management and non-utility generation program
18 which have added between 5 and 10 per cent to the rate
19 outlook.

20 A. There I am talking about the change
21 in the overall long-term rate outlook between the time
22 of the original Demand/Supply Plan and the Update. And
23 that generally applies to all three cases, update
24 nuclear, update fossil and enhanced.

25 Q. All right. Would it be fair that the

1 enhanced plan has extra costs in it because you have
2 left the full amount of demand management and NUGs in
3 them; is that a fair statement, Mr. Dalziel?

4 MR. DALZIEL: A. It turns out to be a
5 higher cost approach, yes.

6 Q. Yes. Just focussing on those two
7 elements, because of that?

8 A. It's a combination of maintaining the
9 demand management levels and the purchase non-utility
10 generation levels. Mothballing existing plant overall
11 turns out to be more costly than managing the surplus
12 by the other illustrative approach in the update
13 nuclear, update fossil causes where the purchase NUGs
14 and the demand management were reduced by varying
15 degrees over the surplus period and existing generation
16 was not mothballed.

17 Q. But if we want to get an exact apples
18 for apples comparison, I take it you can run the
19 enhanced plan and put in exactly the same amount of DM,
20 the same amount of non-utility generation, mothball the
21 same plant so that we can see exactly on a facility per
22 facility basis what the cost of one is as against the
23 cost of the other.

24 MR. SNELSON: A. It's clearly possible
25 to run additional cases, but I think we are getting

1 pretty close to a discussion of running cases for
2 intervenors and so on that was the subject of
3 correspondence among counsel prior to this panel.

4 Q. Mr. Snelson, I am not asking to you
5 run the case. I am just suggesting to you, if you ran
6 the case, having told me that there is extra DM and
7 NUGs in the enhanced case and they are most expensive
8 and if you run the case on enhanced and put them
9 exactly the same conformity in the nuclear, the fossil
10 and the enhanced case, the cost of this enhanced case
11 is going to come down?

12 A. I think we have agreed with that
13 proposal.

14 Q. Now then, the next thing that the
15 enhanced plan assumes is the supplementary energy is
16 taken under the Manitoba Purchase, which is not assumed
17 under the nuclear and fossil columns; correct?

18 A. Yes, that's correct.

19 Q. So again, if you eliminate it and the
20 same playing field as between the two or the three
21 cases, again the enhanced plan could come down in cost?

22 A. I am not so sure of that.

23 Q. Well, is it true, is it not, that
24 taking the surplus energy, according to the documents
25 that I have read, costs you?

1 A. Sometimes it will cost you and
2 sometimes it will not.

3 Q. I understood from the documents that
4 the enhanced plan was more expensive because the
5 surplus energy was being taken.

6 A. My problem here is that the surplus
7 energy was not -- sorry, the supplementary energy of
8 the Manitoba contract was cut out for the whole of the
9 period I believe up to 2010 in the update nuclear and
10 update fossil plans. I think that a more accurate and
11 lower cost assumption would have been to have cut it
12 out for some part of that period but not all of that
13 period.

14 Q. Well, whichever you do, that energy
15 costs you, as I understood your evidence, more than
16 other available energy sources in your system when it's
17 being taken?

18 A. When there is coal-fired energy being
19 produced on the system, then I believe that the
20 supplementary energy generally saves money rather than
21 costing money.

22 It's only if the total energy demand of
23 the system is being supplied by nuclear and hydraulic,
24 that taking the supplementary energy actually costs you
25 money.

1 Q. Well, I am going to have to come back
2 to that because I understood from the documentation
3 that the reason supplementary energy wasn't being taken
4 in the fossil and nuclear plans was because it was
5 expensive to take and therefore a decision was made in
6 those plans not to take it.

7 A. It was a broad assumption in those
8 plans on which with more refinement a better assumption
9 could perhaps be made.

10 Q. And then the final element is the
11 fuel cells and biomass in the enhanced plan, and again
12 those are quite expensive elements of that system.

13 MR. DALZIEL: A. They are higher cost
14 than some of the conventional, if you want to call it
15 that, options, such as the IGCC and the CANDU and the
16 combustion turbine units.

17 Q. The LUECs go up to, from 6 to 21, I
18 think in the case of fuel cells, and 9 to 19 cents per
19 kilowatthour in the case of the biomass, if I have got
20 my notes correct.

21 Do you want to have look at page, I think
22 it's B-7 in Exhibit 646.

23 Do you have that page, B-7, levelized
24 costs?

25 A. Yes. It's indicating a range in the

1 LUEC values for those two options, the biomass and the
2 fuel cells.

3 Q. 6 to 21 cents for biomass and 9 to 19
4 cents for fuel cells per kilowatthour 1991 dollars?

5 A. Yes.

6 Q. So that adding those two elements in
7 to the enhanced plan, no matter how meritorious it is,
8 adds substantial cost on a comparative basis to the
9 nuclear and the fossil alternatives?

10 A. It adds to the cost.

11 Q. So that when you run the cost figures
12 on page 71, cost alternatives --

13 THE CHAIRMAN: 71 of what?

14 MR. HEINTZMAN: Page 71 of Exhibit 682.

15 Q. To demonstrate the difference in
16 costs between the enhanced plan and the other plans,
17 there are a whole series of elements in it that are
18 more expensive than are in the nuclear or the fossil
19 cases.

20 MR. DALZIEL: A. Generally, yes.

21 Q. Most particularly, I suggest to you
22 if you took out -- if you base the enhanced case first
23 of all on a nuclear case, and then you took out all of
24 the elements that differ from the nuclear and the
25 fossil, to make them as comparable unit by unit, as in

1 the three plans, the only difference being these
2 enhancements that you have discussed on the existing
3 system or the new nuclear fossil generation, then the
4 difference between the cases would be substantially
5 different and lesser, is that not apparent?

6 A. Well, generally the costs we would
7 expect them to come down, but the degree to which they
8 would come down would depend on your definition, now
9 getting back to the definition of the enhanced nuclear
10 case. And I sense that you are changing more of the
11 features in the enhanced case and therefore you are
12 moving further away from the philosophy of that case.

13 If you want to have compare the costs, I
14 could suggest two tables where we could do that, and I
15 could give a sense of where I think the costs would
16 change between the two cases.

17 Q. Well, the enhanced case I am talking
18 about is page 33, with the nuclear case as it presently
19 exists by putting on the environmental controls on to
20 any elements of the CANDU or CTU generating we see
21 there, and/or, if necessary, the existing system.
22 That's what I am talking about, the enhanced case.

23 A. For example, would you take the fuel
24 cells out of the enhanced nuclear case?

25 Q. For this comparison, yes. The fuel

1 cells and the biomass out, and then just enhance the
2 nuclear case.

3 A. Then I'm not sure that it is enhanced
4 in the same extent or the same philosophy as the other
5 case. But certainly if you took those other options
6 out then, yes, the costs would come down.

7 Q. And I suggest to you that the
8 enhanced case will get very close to the nuclear or the
9 fossil case if you do that, or do we not have
10 sufficient --

11 A. How do you mean by very close?

12 Q. I can't make that estimation but I
13 guess neither can you, unless you can point me to
14 something that assists us.

15 A. Generally speaking, the way I would
16 have approached this is to say that in the enhanced
17 case, just as a first step, what if we remove the IGCC
18 as the base load option and put in the CANDU 6 as the
19 base load option, and then if we were to leave all the
20 other components and all the other enhancements to the
21 case the same way, then I would expect the cost
22 difference between the enhanced case as we have
23 presented it, and the enhanced case which I have just
24 suggested, would be the same cost difference, the order
25 of the same cost difference between the update nuclear

1 and the update fossil, and that's about \$260 million
2 present value.

3 Now, if you take out some of the other
4 more -- you want to change the enhanced case further by
5 taking out the biomass facilities and the fuel cells,
6 then the cost difference between the two would
7 increase, it would be more than \$260, and I could only
8 take a guess at that -- I don't know, I wouldn't know
9 what it is.

10 Q. So that we bring the difference down,
11 if we compare it on the basis that you describe, down
12 to \$260 million difference; is that what you are
13 saying?

14 A. Yes.

15 MR. SNELSON: A. That was a difference,
16 as I heard it, between the enhanced fossil case and the
17 enhanced nuclear case.

18 Q. Is that what you are saying, or
19 the --

20 MR. DALZIEL: A. The difference between
21 the enhanced case as we have presented it, that's with
22 the IGCCs and the combined cycle facility, the biomass
23 and the fuel cells, if we instead of the IGCC, we are
24 preserving much of the philosophy of that case, but
25 instead of using base load fossil IGCC facilities, we

1 put in CANDU 6 units, then I would expect the cost
2 differences would be very similar to the cost
3 difference between the update nuclear and the update
4 fossil, and that cost difference was \$260 million.

5 Q. And if we make the other changes that
6 we have discussed, you can't tell us now what that will
7 do?

8 A. Well, the cost different would
9 increase, but the degree to which it would increase I
10 couldn't tell you offhand.

11 Q. Okay. I want to turn to another
12 subject and that is the whole timing relationship
13 between where we are under the DSP plans and where we
14 were when the DSP was written.

15 I think it was maybe you, Mr. Dalziel, or
16 Mr. Shalaby, who was discussing with Mr. Mark at Volume
17 150, that in terms of the difference between the need
18 dates under the upper and the median, it was then about
19 eight years and it is still about eight years.

20 Do you recall that discussion?

21 MR. SHALABY: A. Yes, I recall that.

22 Q. So that in that respect there has
23 been no change in the difference between the need dates
24 under those two scenarios; right?

25 A. Generally they are separated by

1 roughly the same number of years.

2 Q. So that if the original update was
3 based on the thought that they were smaller or larger,
4 that would be incorrect. Basically they are still
5 about the same.

6 MR. DALZIEL: A. I think we made a
7 distinction between the need date for major supply and
8 the need date for base load major supply. The need
9 date for major supply generally under the 1989 plan was
10 around the year 1993/94 under upper load forecast, but
11 that the first base load station was coming into
12 service in the year 2002. And then under median load
13 forecast in the 1989 plan, the need date was around the
14 year 2000/2001, so that's where there is that about
15 seven year difference, and the first base load station
16 was coming into service in 2003.

17 So the need date as to when you might
18 first be installing CTUs as a major supply facility,
19 has the seven or eight-year difference. But the
20 difference between the timing at which the first base
21 load station would come into operation was one year.

22 Q. You are talking under Plan 15, are
23 you?

24 A. That's correct.

25 Q. But under Plan 15, as Mr. Mark

1 pointed out to you, you provided for an earlier
2 installation of an IGCC to look after that. We can
3 look at it if you want to.

4 A. The earlier installation of CTUs,
5 which at some point in time in the future they never
6 were converted in the Plan 15, but had the possibility
7 of being converted to combined-cycle and IGCC
8 operation, but as installed in the plan and as modelled
9 in the plan they operated as a peaking facility.

10 Q. But the system was adjusted to look
11 after base load in the early years through the existing
12 fossil and nuclear under Plan 15, and you adjust it,
13 and Mr. Mark went over this with you, I don't want to
14 repeat this, that the need date is about the same
15 between median and lower -- sorry, median and higher,
16 under the present situation as it was under Plan 15.

17 MR. SHALABY: A. The only point Mr.
18 Dalziel is adding is that he wants to make the
19 distinction between need date, period, and need date
20 for base load facilities. That is a second
21 consideration that he wants to bring to your attention,
22 that's all.

23 Q. The need date for upper and median
24 load growth, the difference between those two in the
25 DSP and now is about the same. We are agreed on that

1 at least.

2 A. We accepted that, yes.

3 Q. And the so-called need date for base
4 load is only the date upon which the plan provides for
5 the addition of a unit.

6 MR. DALZIEL: A. And I think what you
7 are getting at is that if in the year 1997 you could
8 have put in a base load station in Plan 15, would you
9 have, the answer is we may well have.

10 Q. Yes. And the reason it was in 2002
11 or 2003 was because that's the time you needed to get
12 the nuclear station going.

13 A. Yes.

14 Q. And so you provided the IGCC or CTU
15 before that?

16 A. That's correct.

17 Q. Right. So it wasn't a question of --
18 if you look at page 15-10 and 5-19, and Mr. Mark went
19 over this with you and I didn't intend to repeat the
20 analysis. You can see there that there is an
21 additional CTU or IGCC generation under the upper case
22 in the years 1993, 1994, and 1997, 2000 and 2001, all
23 of which is there because you take until 2002 to get
24 your planning and installation of the first nuclear
25 station.

1 [3:10 p.m.]

2 A. Yes.

3 Q. Right.

4 MR. SNELSON: A. So not all of it is
5 there for that reason. Some of it is there for that
6 reason.

7 Q. These plans work on need dates, don't
8 they, and the need dates haven't changed. All this
9 page shows you is some changing in the dates of nuclear
10 generation construction based upon the fact you can't
11 get it constructed any sooner.

12 A. It is constrained by the construction
13 lead time.

14 Q. It is constrained by the
15 construction?

16 A. Yes.

17 Q. And that is what this plans tells us,
18 that that is as soon as we can get nuclear constructed,
19 is...2002, I think it says; right?

20 A. That is correct. That was the
21 situation in 1989.

22 Q. So that the date of the construction
23 of the plant on this page doesn't tell us anything
24 about the need date. That is just the date that you
25 can get the facility erected and you are building in

1 the meantime CTU and IGCC, or whatever, to look after
2 base, intermediate and peaking load with your existing
3 system and those new facilities?

4 A. That is correct.

5 Q. Right. So can I then take it that
6 insofar as need dates nothing really has changed?

7 A. The need dates are further back in
8 time.

9 Q. All right. The need dates are
10 further back in time, but the time between - and it is
11 the second point I wanted to make - is really no
12 different looking at it from 1994 forward than it was
13 looking at it from 1989 forward.

14 The first construction of nuclear under
15 Plan 15 was 2002, from 1989 which is some 13, and 2003
16 which is some 13 years away, and in 1994 the time
17 horizon to your planned new construction of nuclear
18 generation is in the same order of magnitude.

19 A. The in-service date of nuclear in the
20 Update Plan is 1999, and by my arithmetic that would be
21 15 years after 1994.

22 Q. Yes. And that is under a median
23 date?

24 A. Did I say "2009"?

25 MS. HOWES: A. No, you said 1999.

1 Q. It is just a Freudian slip, Mr.

2 Snelson.

3 MR. SNELSON: A. The in-service date of
4 nuclear in the Update Plan, I believe, is late 2009.

5 Q. Yes?

6 A. And that is 15 years after 1994.

7 Q. Right. And in the median case under
8 the DSP standing in 1989 it was 2003, which is 14
9 years?

10 A. That is correct.

11 Q. So we are basically in the same
12 parameter in terms of the need date under a median
13 forecast that the writers of this plan were in 1989 if
14 a decision from this Board comes out in 1994?

15 A. Well, we were not anticipating a
16 decision from this Board in 1989, so I don't see the
17 comparability between 1989 and 1994.

18 Q. But wasn't this plan based upon a
19 1989 framework working forward 25 years?

20 A. Yes.

21 Q. So if we apply the same framework,
22 because of the slippage of hearing time and the
23 slippage of demand we are in basically the same
24 relationship as we were looking forward from 1989;
25 isn't that fair?

1 A. We are hopefully more than halfway
2 through this hearing process, so I believe that we are
3 probably further along now than we were in '89.

4 Q. Oh, yes, I know. But in terms of
5 somebody looking with 1989 field glasses on, they are
6 looking forward to major new construction of nuclear
7 under this plan in approximately the same time horizon
8 somebody will be looking forward to 1994 with their
9 1994 field glasses on looking forward to your new
10 construction date of 2009; right?

11 A. Yes. If you push this date forward
12 to '94, then it is 15 years as opposed to 14 years.
13 But I don't see the comparability.

14 Q. Well, I suggest to you that we are in
15 really the same sort of situation in 1994 as we were in
16 1989, and I have gone through two of the criteria with
17 you.

18 Let's look at the third, and that is the
19 kind of demand that you are looking at. If you will
20 turn with me to page 29 of Exhibit 682 and if you look
21 with me, at the same time keeping that page open,
22 looking at page 15-9 of the DSP, Exhibit 3. The median
23 line, which we see on page 29 of Exhibit 682, is very
24 much the same kind of line but somewhat steeper -- no,
25 just about the same steepness as we see under the low

1 forecast on Case 15, and indeed all these cases. They
2 basically work on the same low growth generation with
3 different components.

4 But you see it was going up from zero on
5 page 29 in 2010 to about, it looks like 7.5 to 8
6 gigawatts in 2017, so that is seven years, and on page
7 15-9 we are going up from zero or just above the
8 Manitoba Purchase to just under 10, so about the same
9 order of magnitude of generation required under the low
10 load growth in Case 15 as there is under the median
11 forecast on page 29?

12 A. Yes. That increases, if you ignore
13 the Manitoba Purchase part, it appears to be from about
14 2007 to 2014, compared 2010 to 2017.

15 Q. So exactly seven years in each case?

16 A. A different seven years, but seven
17 years.

18 Q. Yes, seven years, and the growth
19 going up about somewhere between seven and eight. It
20 looks almost exactly the same amount of generation in
21 each case?

22 A. Approximately, it is the same order
23 of magnitude, yes.

24 Q. Which is the point that we covered
25 this morning, that basically the low load forecast in

1 1989 has forecasted very accurately what is now the
2 median forecast?

3 A. This is for new major supply
4 requirements, which is the result of balancing a lot of
5 different components, and I think that fortuitously,
6 that has been the end result, yes.

7 Q. Well, the components are found under
8 this line, under the slanting line, but the slanting
9 line is the same slanting line in each case. That is
10 the demand, the need line, isn't it?

11 A. Well, that need line is the line that
12 I say is the result of a number of balancing components
13 as a result of the changes in basic load forecast,
14 changes in the demand management plan, changes in the
15 non-utility generation plan, changes in the hydraulic
16 plan.

17 Q. Right. So what we see is that Plan
18 15 very accurately prognosticated, although it said it
19 would be in the low load growth situation, which I
20 guess it has turned out to be - to date - what exactly
21 we have now in your median forecast.

22 A. Well, this is the major supply
23 component of Plan 15.

24 And remember that Plan 15 was a
25 Demand/Supply Plan that included demand management,

1 non-utility generation. So we are only looking at one
2 part of that plan.

3 But in terms of the major supply
4 requirement, the major supply requirement of Plan 15
5 under low load growth is quite similar to the major
6 supply requirement currently envisaged under median
7 load growth.

8 Q. Yes. So what I am saying to you is
9 on all the relevant criteria Plan 15 envisaged the very
10 circumstances that you are forecasting under the
11 Update?

12 A. No, I don't believe so.

13 Q. Well, in terms of the difference
14 between your upper and your median need date, in terms
15 of the amount of generation and the period in which it
16 is needed, in terms of the time horizon, all of the
17 things that the DSP was addressing?

18 A. I think when we are planning and we
19 are planning to a range of load growths above and below
20 the median load forecast it is the range that matters,
21 and the fact that the low end of the range of major
22 supply requirements happens to coincide now with the
23 median estimate of major supply requirements to my
24 point of view emphasizes how much things have changed.

25 Clearly, there was a band here, and this

1 was a low end, and that low end of that band has now
2 become the middle of the new band, and that is a large
3 enough change to affect the way in which plans are
4 drawn up and considered.

5 Q. I am not suggesting that the demand
6 hasn't fallen. That appears to be the case. And it
7 may go back up again, might it not?

8 A. That's correct.

9 Q. And that is the whole object of
10 having a flexible plan such as Plan 15, is that it
11 expressly allows for that movement, doesn't it.

12 A. We try to ensure flexibility in all
13 our plans, yes.

14 Q. I mean, there is no point in having a
15 low load forecast situation and to have a generation
16 plan that beats that and then say, well, when that
17 transpires that, well, we have got to throw it out the
18 window, is there? I mean, that is what you have it
19 there for, isn't it?

20 A. It is there to show the effect that
21 if we plan on the median and that we work along those
22 bases and then things change to be the lower, but as
23 soon as you accept that the lower is your new median
24 then -- and if you have flexibility to do so you should
25 change your plans because you now have to envisage the

1 fact that there may be an even lower circumstance that
2 is the lower end of the range.

3 Q. Yes, and there may be an even higher
4 one which would be the higher range?

5 A. The probability of having an even
6 higher one is reduced because you have lowered the
7 range.

8 MR. DALZIEL: A. Just to add to that,
9 what Mr. Snelson is referring to was shown in that same
10 Exhibit 682, at page 82, where if you want to compare
11 the range in major supply requirements you have
12 shown --

13 Q. Sorry, what page are you looking at?

14 A. Page 82 in Exhibit 682.

15 The major supply requirements under
16 median load forecast are the same as the ones we have
17 been looking at at page 29, but in this case there is
18 no requirement for major supply under lower load
19 forecast. That is the point that Mr. Snelson was just
20 making as well.

21 Q. I'm sorry, I am not following you.

22 A. I am just mentioning that we have
23 shown what the range of major supply requirements are
24 under today's circumstances and that the requirements
25 according to median load forecast now correspond to

1 what the requirements for major supply were in 1989
2 under lower load forecast. That is one part of the
3 picture.

4 The other part of the picture is that
5 today there is no requirement for new major supply
6 under lower load forecast.

7 Q. That may well be, but is it not
8 demonstrably correct that the Plan 15 envisaged the
9 circumstance that is now transpiring under the low load
10 growth scenario?

11 MR. SNELSON: A. In this respect the
12 current median expectation is within the range and
13 towards the low end of the range on what was envisaged
14 in '89.

15 Q. Yes. And I suggest to you that if
16 Plan 15 is before this Board and is considered
17 acceptable, then it forms a flexible basis for doing
18 exactly what is now transpiring, i.e. planning to what
19 will happen in 2009, 2010, or additional or lesser
20 supply, because the plan has envisaged the circumstance
21 that we now presently have; is that not fair?

22 A. We have talked about this being a
23 balance between a variety of things, and I am not sure
24 when you say Plan 15 whether you mean the major supply
25 component of Plan 15 or Plan 15 in its totality,

1 because the totality of Plan 15 includes the demand
2 management and non-utility generation, the hydraulic,
3 the Manitoba Purchase, all of the other aspects of the
4 Demand/Supply Plan.

5 Q. Yes. And it has envisaged and taken
6 account of the circumstance which we now have before us
7 insofar as it may be now the median and was then
8 thought to be the lower; isn't that fair?

9 A. And I have indicated that the change
10 of expectation of what was previously thought to be the
11 lower now being considered to be the median is very
12 significant in planning and is the sort of significant
13 change that has driven the changes that are in the
14 Update.

15 Q. And that is the kind of change you
16 would expect over time?

17 A. I think that we do see changes like
18 that over that time. I think we have seen a rather
19 larger than normal change over the last three years.

20 Q. And did we not see those changes in
21 the early 1980s where demand fell off very
22 substantially and then accelerated through the 1980s
23 such as we had never seen it before?

24 A. There was low load growth in 1981/82
25 during a recession, and load growth picked up quite

1 rapidly beyond that.

2 Q. To the highest levels we have ever
3 seen in Ontario in the 1980s?

4 A. I indicated that in my direct
5 evidence, yes.

6 Q. Yes. So the same thing could happen
7 again?

8 A. It could happen again.

9 Q. Now, the difference, I suggest to
10 you, between what we now have on page 29 and what we
11 had before - page 29 was 682 - is that, as you pointed
12 out, this is now the median.

13 If you look with me at page 30 where we
14 have -- so, being the median, this now has something
15 like a 60 per cent probability of occurring rather than
16 a 20 per cent possibility of occurring when it was the
17 low load forecast, major supply program? Would I be in
18 the right ballpark on those numbers?

19 A. When we have to divide the future up
20 into three sets of circumstances and say this is like
21 median, this is like upper, this is like lower, we tend
22 to use those sorts of weightings.

23 Q. Yes.

24 A. The load forecasters tell us the
25 probability of it being exactly as they forecast the

1 median is zero, but...

2 Q. All right. Well, I see in Exhibit 6
3 the median is 26 per cent, but in any event, I
4 understood you to be using for median purposes 60 per
5 cent, upper 20, lower 20.

6 A. When we have to divide the future
7 into three categories we use those -- and in those
8 three categories we use those weightings, yes.

9 Q. So that the probability, if I can use
10 it that way - and I am not hanging you on this
11 percentage - of page 29 and page 30 happening now is in
12 the order of 60 per cent instead of as it was, 20 per
13 cent?

14 A. Something closer to the median than
15 to upper or lower we would associate as having a 60 per
16 cent probability.

17 Q. Okay. And so the cost of this plan
18 being wrong or costing more than it should, the
19 ramifications of that are now much more severe than
20 they were when it was only a 20 per cent possibility?

21 A. There is a higher weight put on
22 evaluating what would be the median, yes.

23 Q. Yes.

24 A. And so in any cost evaluation there
25 will be more weight put on this scenario than there

1 would have been when it was the lower.

2 Q. Right. And it is an order of three
3 to one from the statistics I see in Exhibit 6, and Mr.
4 Mark took you through some of those, that your median
5 probability being 60 per cent and your low or high load
6 growth forecast being 20 per cent, that the costing
7 allocation is three times as much on the median cost?
8 [3:30 p.m.]

9 A. In this way of describing
10 probabilities, yes.

11 Q. Now, let's look at this plan on page
12 30. I think Mr. Rodger pointed out to you that you are
13 contemplating installing something like 12 or 13 units
14 in seven years, nine of which are nuclear stations.

15 A. Yes.

16 Q. Now, sir, what would occur to Ontario
17 Hydro if those seven years were very adverse in terms
18 of economic conditions, very high interest rates, very
19 adverse years for construction? Would that have an
20 economic harm to Ontario Hydro if it had compressed
21 into seven years that kind of generation?

22 A. Costs might be higher than they would
23 otherwise be.

24 Q. Costs could be very substantially
25 higher than they would otherwise be by compressing into

1 7-1/2 years this tremendous generation program; isn't
2 that fair to say?

3 A. If these were bad years for
4 construction costs would be higher. This is the sort
5 of rate of installation of capacity that we have
6 experienced before.

7 Q. I suggest to you that under the
8 median forecast in the prior plans, the generating
9 capacity construction is spread out over 12 or 13
10 years; isn't that fair to say?

11 A. It's spread out to match the need for
12 generation, yes.

13 Q. Yes. But you can adjust your other
14 programs to make sure that you generate, you develop
15 your generation over a longer period of time.

16 A. You could do that.

17 Q. Yes. And that's one of the
18 directives of the DSPS, is it not, resource smoothing?

19 A. Resource smoothing, yes.

20 Q. So the whole planning philosophy in
21 the DSP is carried into the plans that are there
22 contained which spread out, particularly at the median,
23 the construction of generation capacity; that's fair,
24 isn't it?

25 A. The construction of generating

1 capacity in the median is spread out because the need
2 for generation is spread out in the median.

3 Q. Yes. And you can adjust that by
4 holding back on your DSM program or on your NUG
5 program, or any of your other elements to make sure
6 that your basic base load construction is done over a
7 number of years to obviate the economic disaster that
8 can occur if you built all of it in seven years?

9 A. You could slow down your demand
10 management and NUG programs and end up with the
11 generation program, major supply program spread out
12 over more years, that would be contrary to the main
13 thrusts of the strategy in terms of giving preference
14 to demand management and non-utility generation to
15 delay the need for major supply as much as possible.

16 Q. And the demand management and NUG
17 program is not so dependent on huge capital costs for
18 expenditures of construction of the nature that we see
19 in the program set forth on page 30 of 682; is it?

20 A. That's one of its advantages.

21 Q. That's one of its advantages.

22 So you have really constructed a scenario
23 here that pushes all of this construction into a very
24 narrow time horizon because of your dedication to
25 demand management and NUGs and the other elements of

1 your program?

2 A. That is one of the effects of giving
3 priority to demand management non-utility generation.

4 Q. And the other thing that, the other
5 aspect of this that is important, I would suggest to
6 you, is that --

7 MR. SHALABY: A. I want to add that what
8 you see there, the seven year period, it has a Biblical
9 sound to it, but the seven year where you are get all
10 these nuclear units, the construction period is much
11 longer. Construction of these plans starts years in
12 advance of that. So you are not doing everything
13 within seven years. Construction and definition and
14 engineering work takes five, six, seven, eight years
15 ahead of that, and commissioning and training and other
16 things take a few years after that.

17 So the window in which these units sort
18 of hit the construction market and engineering market
19 is much wider than the seven years you are talking
20 about.

21 Q. But they are marching along, they are
22 starting earlier than 1990, but they are marching along
23 together from whenever out to 2015, this huge
24 construction program?

25 A. Yes. But all I am saying is you have

1 to hit a period of bad luck that is much longer than
2 seven years to get the effect that you are talking
3 about.

4 Q. But if you have adverse economic
5 circumstances through those years you are going to have
6 much more harm to Ontario Hydro and Ontario citizens
7 that if you spread out your construction of your base
8 load in major supply program; fair?

9 A. They are spread longer than seven,
10 perhaps 10 or 12 or more. If you spread them even more
11 than 10 or 12, you are quite right, you reduce your
12 exposure to a period of high economic uncertainty.

13 But all I am saying is a 10 or 12-year
14 period of construction is less likely to be all bad
15 than perhaps the six or seven that you are talking.

16 Q. Well, you are taking me right to the
17 next point I was going to make, Mr. Shalaby. I was
18 wondering if you could turn to page 15-9 to explore
19 this point. Because the DSP at each of the cases which
20 it set forth had an express system for moving from one
21 load growth scenario, one construction scenario, to the
22 next; didn't it?

23 MR. SNELSON: A. I am not quite sure
24 what you mean by that.

25 Q. Well, the whole idea of the system

1 that we see configured in figure 15-9 is that you have
2 a certain generating philosophy, you gear that up so
3 that by getting your approval up front you can then
4 move forward as need be into the definition stage, and
5 you can then bring on the units, either in the upper
6 load growth which we see in the first part of the
7 chart, the median load growth, or the lower load
8 growth; right?

9 A. Yes.

10 Q. So it was a whole systematic approach
11 to planning premised on getting your approval upfront,
12 getting yourself ready to move forward in case upper
13 load growth occurred, and being progressively planning
14 and designing towards the need date as it occurred from
15 time to time; right?

16 A. Yes.

17 Q. Right. So that when and if you come
18 to the lower load growth, which we see on figure 15-9,
19 although it's a steep line, it's not what I will call a
20 shock to the system because you have already got your
21 approval, you have already done your definition phase
22 to the extent that you need to. In fact, you were
23 ready for this back in about the year 2002 to go with
24 your first CANDU "A"; right?

25 A. No.

1 Q. Why not?

2 A. I think our assumption under low load
3 growth in the 1989 Demand/Supply Plan was that any
4 approvals that we had obtained in the 1990s would have
5 to be redone because of the long delay between the time
6 of acquiring the approvals and the time when the
7 approvals would be actually used.

8 Q. I'm sorry, you say the DSP
9 contemplated getting new approvals?

10 A. Yes.

11 Q. And can you show me anywhere in the
12 DSP, Exhibit 3, where that's stated?

13 A. It probably is in Exhibit 6 but I am
14 not sure that I could find it without spending a fair
15 amount of your time.

16 The assumptions were that the costs of
17 acquiring approvals in the 1990s would be a cost that
18 would not be utilized in the low load growth case.

19 Q. Well, I'm sorry, I thought that the
20 whole system here was designed to meet all of the three
21 load growth scenarios.

22 Could you turn with me to the DSP to page
23 15-4. Now, down the left-hand side of the page it
24 says -- well, starting with the bandwidth forecast
25 heading:

1 Each case was tested against the
2 bandwidth forecast consisting of five
3 electricity demand paths.
4 And the five included the low load growth
5 forecast, did it not, Mr. Snelson?

6 A. That's correct.

7 Q. And continuing down the next
8 paragraph:

9 These five paths test the ability of
10 each case to accommodate changes in
11 forecast electricity demand. If the load
12 rises more quickly than the median, then
13 additional generation is added if
14 possible. If load grows slower than the
15 median new generation is deferred or
16 existing generation is mothballed. Cases
17 were rejected which were designed
18 primarily to meet the upper forecast.
19 Such cases would have enough generation
20 to meet all criteria as economically as
21 possible under the upper forecast but
22 would be overbuilt and have excessive
23 costs under the median or lower. Cases
24 designed primarily to meet the median
25 forecast were also rejected...

1 And that's instructional in light of your
2 present Update,

3 ...because they would not include the
4 early preparatory work that provides the
5 flexibility to meet the upper forecast.
6 Cases designed primarily to meet the
7 lower forecast were rejected because
8 under the median or upper load forecasts
9 these cases would have poor reliability,
10 et cetera.

11 So the cases were designed to meet all of
12 the plans, all of the load forecasts. And if you read
13 each of the cases starting on page 15-8, they each say
14 that they are going to be advanced or delayed as
15 necessary.

16 Would you turn to the Executive Summary,
17 page X, Roman numeral X, paragraph 8, second sentence.

18 Because of the difficulty in
19 accurately forecasting demand over such a
20 long period, the plan will permit all
21 demand to be met which falls between the
22 range between the upper and lower
23 forecasts.

24 And page XV, paragraph 33:

25 Timely approvals are requested to

1 permit the upper load forecast to be met.

2 The actual commitments to build
3 facilities will be made on the basis of
4 actual load growth experience. The
5 approvals to meet the upper load forecast
6 are required so that Ontario Hydro will
7 have the flexibility to adjust if load
8 growth is higher than the median
9 forecast.

10 THE CHAIRMAN: We are coming to a
11 question fairly soon, I hope.

12 MR. HEINTZMAN: Q. Let's look at page
13 18-1.

14 MR. SNELSON: A. 18-1, we are now out of
15 Roman numerals?

16 Q. No, it's chapter 18, action plans.
17 The very bottom of the page, 18-1:

18 As stated in the demand/supply
19 planning strategy, the preparations for
20 the options definition phase will be
21 taken in time to meet the upper load
22 projections while avoiding the cost of
23 premature commitments. If the actual
24 load trend is below the upper forecast,
25 the project commitments will be delayed

1 to just-in-time requirements.

2 Now, am I not reading this as telling us,
3 and I can read other parts, that this plan provides for
4 and requests approvals that will cover the upper, the
5 median and the low load forecast?

6 A. Plan 15 did request approvals that
7 were early enough to allow the upper load forecast to
8 be met with major supply options. And as you have
9 indicated, the strategy was to delay the actual
10 implementation of those approvals if the load was
11 recognized as being less than the upper load forecast.

12 The point I was making about the lower
13 load forecast is that I believe that in the cost
14 analysis of the 1989 Demand/Supply Plan, because there
15 was such a long gap between obtaining approvals and
16 using them, then it was assumed that those costs were
17 essentially absorbed and that the approval process was
18 restarted for a later in-service date.

19 Q. Well, I must say I have never seen
20 that, if you would like to point that out to us. It's
21 not in the DSP.

22 A. I can't just sit here and flip
23 through.

24 THE CHAIRMAN: Perhaps we could take the
25 break and maybe when we come back from the break he

1 will have that. We will break for 15 minutes.

2 THE REGISTRAR: Please come to order.

3 This hearing will recess for 15 minutes.

4 ---Recess at 3:50 p.m.

5 ---On resuming at 4:09 p.m.

6 THE REGISTRAR: Please come to order.

7 This hearing is again in session. Be seated, please,

8 MR. SNELSON: Mr. Chairman, if I could
9 perhaps -- sorry.

10 THE CHAIRMAN: Mr. Campbell wants to
11 exercise his prerogative.

12 MR. B. CAMPBELL: I have very few
13 prerogatives and almost none with respect to my
14 witnesses, so I will take full advantage of the
15 opportunity, Mr. Chairman.

16 Mr. Chairman, I would just like to again
17 for those who are trying to -- sometimes after the
18 hearing it is hard. People take off, and this is the
19 last day of the week, and people are reading the
20 transcript for next week.

21 I believe I now have all of the documents
22 that AECL wants to use in cross-examination with the
23 exception of one that they have said is being forwarded
24 to us overnight. I'm not quite sure who is going next
25 on Tuesday, it may be CEG, and who follows them.

1 I would just like to ask that if those
2 people are here if they can get documents to us in time
3 for them to be distributed before the weekend I
4 certainly think it is far fairer to the witnesses than
5 producing them like rabbits out of a hat, and I would
6 ask that people do so.

7 And if I am wrong about my assumption
8 about the documents from AECL, perhaps I would ask
9 them, too.

10 THE CHAIRMAN: I have been asked to do
11 some forward planning as well for the hearing, and that
12 is that it seems to me there is an interest in whether
13 we are going to sit on Thursday, July the 2nd. The
14 answer to that is no, we are not going to sit on
15 Thursday, July the 2nd.

16 MR. SNELSON: Perhaps, if I may, I would
17 like to clarify the matter that was under discussion
18 just before the break.

19 And my understanding was in fact
20 incorrect, that the approval costs were not in twice.
21 The approval costs were separated in the lower load
22 growth case and assumed to have occurred in the early
23 1990s when the approval processes were going on, the
24 approval and definition phase work and so on necessary
25 to get approval.

1 They were separated, but they were not
2 repeated.

3 There is, however, I believe, a
4 significant risk that approvals that are not exercised
5 for seven years or so after they have been obtained may
6 need to be repeated in some respects before they can be
7 exercised.

8 MR. HEINTZMAN: Q. The DSP, Exhibit 3,
9 contains nuclear, fossil, hydraulic, all sorts of
10 installations that don't occur until 2009 through 2017,
11 I think. Is that not fair?

12 MR. SNELSON: A. The DSP did not ask for
13 approval for facilities that were required through the
14 whole 25-year period, only those for which an
15 environmental assessment would expect to be submitted
16 within five years.

17 Q. But the facilities, even the
18 hydraulic and the nuclear and fossil that we see in it,
19 go out to 2009 and beyond?

20 A. The facilities were laid out for the
21 full 25-year period.

22 Q. And the approval was being obtained
23 then and there in the DSP; it was being asked for
24 upfront?

25 A. Not for the full 25-year period.

1 Q. Well, for facilities out to and
2 including that full period?

3 I can take to you some of them. They are
4 way out at the end of the period. I was going to do
5 that later. Let's come back to that, unless you have
6 got some reference you want to make right now.

7 MR. DALZIEL: A. In reference to the
8 hydraulic plant, the approvals that were sought in '89
9 I believe included the sites or the projects associated
10 with what is called the Abitibi Complex, and in '89
11 they were shown as coming into service over the period
12 2000-2004.

13 Q. Sorry, what page are we on?

14 A. Well, starting at Exhibit 3, page
15 19-2.

16 THE CHAIRMAN: Excuse me for
17 interrupting. Just to take an example right out of the
18 air, looking at Plan 15 it provides for a CANDU "C" and
19 a CANDU "D". In the request for approvals neither
20 CANDU "C" or CANDU "D" are included. Is that what you
21 meant, Mr. Snelson?

22 MR. SNELSON: I believe we asked for
23 approval for CANDU "A" and CANDU "B".

24 THE CHAIRMAN: You just asked for CANDU
25 "A" and "B", but the plan itself calls for CANDU "C"s

1 and CANDU "D"s. So that is the point you were trying
2 to make?

3 MR. SNELSON: Exactly.

4 MR. HEINTZMAN: Q. Well, we will come
5 back to that later because I have some more organized
6 thoughts than that.

7 But the point that you and I were
8 discussing, Mr. Snelson, is that these Plans, 15, 22,
9 23, were built on a system basis that slid from load
10 growth to load growth; right?

11 MR. SNELSON: A. Yes, to some degree.

12 Q. Well, entirely?

13 A. The assumption was that we had the
14 maximum that we could get from demand management
15 non-utility generation and hydraulic, and that
16 therefore all of the differences between upper and
17 lower load growth would be taken up by changes in the
18 major supply plan.

19 Q. Yes. And you can adjust the DSM or
20 whatever you wish to, but the major supply portion of
21 the plan, if we look at page 15-10 and -11, and for the
22 units as we see them coming in, and on page 15-9 for
23 the graphic representation of it for Case 15 we can see
24 that in effect the system moves out, if you like, from
25 the lower out to the upper or back from the upper --

1 historically, you would be ready for the upper and you
2 would move things back as you don't require them to the
3 lower? That was the whole system built into these
4 plans?

5 A. Yes.

6 Q. Yes. So that the point I am making
7 is that even though -- and if we look up on the top
8 right-hand corner the lower forecast required
9 generation under Case 15, which if you look at page 30
10 of Exhibit 682 is very similar, you had been prepared
11 long before 2008 or 2009 with approvals, with
12 definition to the extent thought necessary and
13 everything to meet an upper forecast possibility in
14 2002 for nuclear generation?

15 A. You are saying that some of the
16 preparations for the upper would have been that early,
17 and then they would have been used later for the lower?

18 Q. Yes.

19 A. Yes.

20 Q. Yes. So that the whole system was
21 premised on that kind of a sliding system?

22 A. To a degree, yes.

23 Q. Well, entirely?

24 A. There are some options that don't
25 slide. For instance, there are combustion turbines,

1 not convertible, which are shown as being the first
2 segments of capacity in the upper load growth, which I
3 don't believe are used in any other scenario.

4 Q. But those were only there because you
5 couldn't get generating up fast enough in terms of
6 construction lead time, definition and acquisition;
7 isn't that correct?

8 A. They were there because they were the
9 shortest lead time option, and you couldn't get other
10 options in time, yes.

11 Q. Yes. But everything that was
12 constructible and definable, et cetera, in time, moves
13 on a sliding path from the upper to the median to the
14 lower basically? There may be some exceptions?

15 A. Yes, I have agreed that basically
16 that is what happens.

17 Q. So if you arrive at the lower there
18 is no shock in trying to build the construction program
19 that is shown on the top right-hand corner of page
20 15-11 because you have been ready, willing and able to
21 do all of that long beforehand?

22 A. In this circumstance, you would have
23 been ready in some respects well in advance of the
24 actual needs or dates that you do things, yes.

25 Q. And that is one of the logics behind

1 the DSP and behind the plans and the cases that were
2 put forward?

3 A. The logic was to be ready in time for
4 the upper, and one of the consequences of that was that
5 you may be ready in good time for the median and very
6 good time for the lower.

7 Q. Right. And if we compare that to the
8 Update, the Update doesn't provide for a system to get
9 your approvals well in advance to meet the upper case,
10 does it?

11 A. The Update provides for flexibility
12 by different means.

13 Q. Can you answer my question: It
14 doesn't provide for obtaining approvals to meet the
15 upper case?

16 A. It does not.

17 Q. Yes. And so it doesn't contain,
18 expressly on its face in any event that I can see, any
19 system of moving generation in this consequential
20 fashion that is expressly built into Plan 15 and the
21 other plans, does it.

22 A. It hasn't laid out in the same way
23 upper and lower and median scenarios.

24 Q. Yes.

25 A. We have given you upper and lower and

1 median scenarios in our documents.

2 Q. Well, I will be coming to the upper
3 case, but your upper case is not a case built on or
4 arising from the median case construction; in fact,
5 your upper case is a case that is both a nuclear and
6 fossil upper case?

7 A. That is correct.

8 Q. And it doesn't bear any graduating or
9 connection basis to your median case, does it. We can
10 look at it. It has got all sorts of units in it that
11 aren't in the median nuclear case.

12 A. Well, as we have indicated, the
13 median case does not seek approvals within the next
14 five years. The upper case is built on the premise
15 that if you have not sought approval within this time
16 period, then what sort of would be a reasonable plan
17 based upon that in developing into the future.

18 Q. But you have agreed with me that your
19 upper case, as and to the extent it is presented in the
20 Update, doesn't bear this graduated relationship to the
21 median case such as the DSP expressly provided for?

22 A. The cases for major supply beyond the
23 period where we are seeking approvals, then, as we have
24 indicated, we haven't made choices, and so the median
25 cases, we show a median case with nuclear future beyond

1 2009, we show a median case with fossil beyond 2009.

2 We haven't selected between those. And the upper load
3 growth case includes some features of both of those.

4 Q. So the upper case you put forward in
5 the DSP isn't built on a graduated and consequential
6 basis on the median as are the plans in the DSP?

7 A. The relationship is not the same.

8 Q. Yes. Thank you. And the necessary
9 result of all that is until there is another DSP
10 hearing, if this Board doesn't give approval for major
11 supply, Hydro cannot proceed with definitional work on
12 major new supply?

13 A. No, that is not true.

14 Q. And why is that?

15 A. Ontario Hydro does not need
16 environmental assessment approval to conduct definition
17 phase studies.

18 Q. So you say you are going to go ahead
19 with definition phase studies...when?

20 A. When we see them as being necessary.

21 Q. So it could be tomorrow?

22 A. Theoretically, but I don't think
23 practically so.

24 Q. Why? Because of the nuclear
25 moratorium?

1 A. Well, we could go ahead with
2 definition phase studies on a new coal-fired plant or a
3 new gas-fired plant, and the nuclear moratorium is
4 immaterial to that.

5 Q. But you can't go ahead on
6 definitional phase because of the nuclear moratorium on
7 nuclear?

8 A. That is correct.

9 Q. And your approach, in my
10 submission -- and I suggest to you, and I don't want to
11 go over the ground that Mr. Mark has already gone over
12 with you where he discussed with you the costs that
13 your approach has if you go into the definitional
14 phase, and you will recall your discussion with Mr.
15 Mark on Exhibit 452D, or maybe it was Mr. Shalaby or
16 Mr. Dalziel who discussed that.

17 I am going to assume that Ontario Hydro
18 does nothing more with its approval than wait until it
19 would otherwise wait under your scenarios to go ahead
20 with definitional work, and I am not going to get into
21 the debate in Exhibit 452 as to what the costs of
22 planning to the upper are if you start definitional
23 work.

24 Are you with me?

25 A. I think so. I am waiting for the

1 question. I will see if I understand the question.

2 Q. I think you agreed with Mr. Mark that
3 the first cost is that you are going to have to have a
4 new DSP hearing if this Board doesn't approve major new
5 supply? You will have to have the cost of a new DSP
6 hearing?

7 A. There will be the costs of whatever
8 approval processes are appropriate, and for obtaining
9 environmental approval of major supply additions that
10 can either be done as a two-stage process with a plan
11 hearing and project-specific hearings as we are doing
12 it now, or it could be done as a one-stage process.

13 Q. Well, whichever way it is done there
14 is going to have to be a rationale hearing separate or
15 as a part of a site-specific hearing?

16 A. Either separate or as a part of, yes.

17 Q. And that is going to require an
18 additional cost, both as to out-of-pocket money and
19 time?

20 A. Yes.

21 Q. And the second cost I have just
22 reviewed with you; that is, the cost or the potential
23 cost of pushing all of your construction into
24 seven-and-a-half-years and being hostage to the
25 economic circumstances that exist at that time? That

1 is a real cost, isn't it.

2 A. There is some element of cost risk
3 associated with it.

4 Q. Yes. And the third cost is the cost
5 of eliminating potential options that you might have
6 selected but you can't select because you pushed off
7 your planning horizon; right?

8 A. There is the potential for such a
9 cost if processes are delayed beyond the lead time of
10 the longest option.

11 Q. Yes. And that is expressly dealt
12 with at page 13-7 of the DSP. Could you turn with me
13 to that page - page 13-7 of Exhibit 3?

14 About halfway down the first paragraph on
15 the lefthand side:

16 Some options can be put in place in
17 two to three years while other options
18 take seven to 14. Since long lead time
19 options often have economic and other
20 advantages planning that restricts itself
21 to short horizons will not result in a
22 balance of options which best serve the
23 long-term electricity requirements of the
24 province.

25 That is a correct statement; is it not?

1 A. Well, I am not sure whether you are
2 looking at the same version that I am looking at, but
3 the numbers in my version are different to yours. You
4 said that some options can be put in place in two to
5 three years.

6 Q. Sorry, two to five years.

7 A. Mine says two to five. And then you
8 said other options take seven to 14, and it says eight
9 to 14 in my copy.

10 Q. Well, I am going to have to go back
11 and read the transcript because mine says the same, and
12 I thought I said that.

13 A. Well, I'm sorry, if I misheard you,
14 but...

15 Q. But I was concentrating on the next
16 sentence, that:

17 Planning that restricts itself to
18 short horizons will not result in a
19 balance of options which best serve the
20 long-term electricity requirements of the
21 province.

22 That is a true statement?

23 A. That is directionally a true
24 statement, yes.

25 Q. Yes. And to the extent --

1 MR. SHALABY: A. It starts, however,
2 with: Since long lead time options often have economic
3 and other advantages...

4 Mr. Snelson started saying that some of
5 the long lead time options are starting to lose some of
6 that advantage over the short lead time options, so I
7 think that is a fundamentally different situation today
8 than it used to be at that time.

9 Q. Well, is it not still true that long
10 lead time options often have economic and other
11 advantages?

12 A. But today we indicate that that
13 advantage is diminished from the way it was three or
14 four years ago.

15 MR. SNELSON: A. Not eliminated; it is
16 diminished.

17 Q. It is diminished as you perceive it
18 between some options?

19 A. Yes.

20 Q. And to the extent that you eliminate
21 that choice that is a cost, isn't it?

22 A. If that choice was the most economic
23 choice, then there would be a cost associated with it.

24 Q. And the paragraph continues:

25 It is prudent, therefore, to undertake

1 commitments to major supply in a way that
2 allows maximum flexibility to respond to
3 uncertainty. There is a long chain of
4 activities needed to put major supply
5 options in place (design and studies,
6 approvals, construction). Therefore, it
7 is important to move forward with the
8 required design and secure the required
9 approvals while holding off the
10 commitment to construction until the year
11 of need becomes clear.

12 That is a true statement?

13 A. Yes, and subject to the
14 qualifications that I gave in my direct evidence and
15 Mr. Shalaby has reminded you of.

16 Q. Yes. And another cost, and it is a
17 related cost, is the cost imposed by shrinking or
18 putting shrinking pressure on the definitional phase of
19 a project?

20 There has been quite a debate and
21 exploration of that within Hydro, particularly in the
22 nuclear cost inquiry.

23 Are you aware that by taking a good deal
24 of time in the definitional phase, spending your time
25 getting things right, you save tremendous amounts of

1 money in the acquisition stage?

2 A. I understand that that is one of the
3 conclusions of the cost and schedule reduction studies
4 for nuclear.

5 Q. Yes. And you had a discussion, which
6 I won't take you to, Mr. Shalaby, with Dr. Connell in
7 Volume 49 and Volume 60 on that same point, that if you
8 press down on your definitional phases you could end up
9 spending a lot more money in your acquisition phase?
10 Do you agree with that?

11 MR. SHALABY: A. I accept what was said
12 earlier, yes.

13 Q. Fine. And to the extent that by
14 pushing off the approvals date to, let's say, 10 years
15 before your nuclear installation is required - and that
16 is the minimum time that is required - then you are
17 putting the maximum pressure on you to do your planning
18 and to be ready for construction, aren't you?

19 [4:30 p.m.]

20 MR. SNELSON: A. As I have said, the
21 approval date that we are talking about is the time
22 when an environmental assessment is submitted. Some
23 definition work can precede that.

24 Q. But to the extent that you delay your
25 approvals and to the extent that you put pressure on

1 your definitional phase, you are going to run into
2 risks in terms of increased costs; aren't you?

3 A. There are balances that have to be
4 made between having enough time to do a sufficient
5 amount of preliminary engineering during the definition
6 phase, that, as you have put it, you can build the
7 plant right instead of building it wrong and then
8 building it right again.

9 Q. Yes.

10 A. So there is a balance between that
11 and there is a balance between the need to avoid
12 spending money, avoid making decisions that lock you in
13 before you need to.

14 Q. But if you have the flexibility to do
15 either, then you are maximizing your choices and you
16 are minimizing your costs; aren't you?

17 A. There are advantages in starting soon
18 enough to have time to do a good definition phase
19 study, yes.

20 Q. Right. Thank you.

21 And when we look at this program you have
22 got on pages 29 and 30 of Exhibit 682, I guess this
23 line which is now the median showing 8,700 megawatts,
24 the risk again - and this translates into costs - is
25 that you may have to do lot more than that, but that

1 could happen and that's an additional cost; isn't it?

2 A. I'm sorry, I didn't quite capture
3 what is the additional cost.

4 Q. That you may have to do more earlier
5 than is shown on pages 29 and 30.

6 A. More of what?

7 Q. More generation.

8 A. Yes.

9 Q. You may have to do it earlier?

10 A. Yes, that would be the sort of
11 circumstance under the upper load growth scenario.

12 Q. And to the extent that you are not
13 ready for it, to the extent that you don't have
14 approvals, to the extent you have to do it earlier and
15 more of it, that's going to add increased cost; isn't
16 it?

17 A. It may do.

18 Q. Yes. And that can happen by virtue
19 of any number of circumstances including increased
20 demand; right?

21 A. Yes.

22 Q. Decreased success of your demand/
23 supply management and NUG program?

24 A. Yes.

25 Q. A decision not to proceed with your

1 fossil extensions?

2 A. Or shorter lives of fossil plant.

3 Q. Yes. Or increased demand of
4 electricity to meet increased environmental standards
5 in Ontario. That's a possibility, too; isn't it?

6 A. Sorry, increased?

7 Q. Use of electricity because of the
8 increased environmental standards imposed by Ontario?

9 A. That's one circumstance that under
10 some circumstances could contribute to higher load
11 growth.

12 Q. Yes. And all of those are going to
13 result in higher costs in a circumstance where you
14 don't have the time or as much time or as much
15 flexibility as you would have if you had got your
16 approvals earlier and had embarked on your planning
17 earlier; right?

18 A. Theoretically, yes. But I think the
19 point that one has to come to here is that when you are
20 planning for upper load growth and you are trying to
21 maintain flexibility for upper load growth, then you
22 can't usually plan on having the most economical
23 program to meet the upper load growth. You have to
24 plan on a plan that is reasonably economical under
25 median load growth and has the capability to at least

1 maintain reliable supply without excessive costs in
2 upper load growth.

3 So in the 1989 Demand/Supply Plan, the
4 need time for generation under upper load growth was
5 about 1993 as Mr. Dalziel has said. And that plan for
6 upper load growth managed through to 2002 with
7 combustion turbines and other such options until you
8 could put a base load supply in at about the time that
9 you were actually planning on it for median load
10 growth, and that difference between when you need
11 generation and when you bring in the base load option
12 was about nine years.

13 In our current circumstance --

14 Q. Where do you get the nine years?

15 A. '93 to 2002.

16 Q. I think we said eight years before,
17 but okay. Go ahead.

18 A. I am just giving you the principle.

19 Mr. Shalaby has pointed out to me that we
20 actually put in some generation somewhat ahead of that
21 in the median.

22 But the point I am getting at is that you
23 need generation around 1993 in upper load growth and
24 your first base load addition is 2002, which is about
25 nine years after you need some generation, and it is

1 actually one year earlier than you put in the base load
2 plant under median load growth.

3 We are in the very similar situation
4 today as regards to those times. We see the first
5 steady and significant need for generation under upper
6 load growth around the year 2002, and the current plans
7 are thinking about having base load options available
8 around the year 2009, which is about a seven-year gap
9 between them.

10 So it's not as though in this current
11 plan we have to struggle along with combustion turbines
12 under upper load growth for a much longer period than
13 we did under the 1989 Demand/Supply Plan. They are
14 actually quite similar.

15 Q. I agree with you 100 per cent.
16 That's the point I have been trying to make and I am
17 grateful for you pointing that out.

18 I was curious in this process of this
19 just-in-time planning. Was it you, Mr. Shalaby, or
20 you, Mr. Snelson, who coined that phrase, just-in-time
21 planning?

22 MR. SHALABY: A. Actually, it was
23 president of the company, but we introduced it here.

24 Just-in-time planning is in the --
25 just-in-time commitment is mentioned in the exhibits,

1 and I think we both mentioned it some time or another.

2 Q. I suggest to you that just-in-time
3 planning is an oxymoron. It's a contradiction.

4 A. Just-in-time commitment is the word
5 that I used.

6 Q. You will agree with me that
7 just-in-time planning is a contradiction.

8 A. You introduced the term, you can
9 explain it better than I can.

10 Just-in-time commitment is the word that
11 we use.

12 Q. We can look at the transcript as to
13 what was said.

14 But you will agree with me that
15 just-in-time commitment takes a lot of planning.

16 A. Yes.

17 Q. In fact, the Japanese who have
18 perfected just-in-time delivery of deliveries have
19 developed tremendous planning to accomplish
20 just-in-time deliveries for inventory control. Are you
21 aware of that?

22 A. No, but I can accept that.

23 Q. You're right, on page 18-1 of the
24 report, Exhibit 3, on the right-hand column: This
25 permits just-in-time commitments. And that's all based

1 on the whole long-term planning inherent in the DSP,
2 isn't it, without which that just-in-time commitment is
3 impossible.

4 A. I agree.

5 Q. Yes. And that's the whole philosophy
6 behind the DSP, to have long-term planning so that you
7 can have just-in-time commitment; right?

8 A. Yes.

9 Q. And I suggest to you without
10 long-term planning you won't get it.

11 And I would ask if we can just look at a
12 speech that Mr. Franklin gave on this point. I think I
13 have given to the members of the panel a copy of that.

14 THE REGISTRAR: Do you want this marked,
15 Mr. Heintzman?

16 MR. HEINTZMAN: Yes, it may be marked.

17 THE REGISTRAR: 691, Mr. Chairman.

18 THE CHAIRMAN: Thank you.

19 ---EXHIBIT NO. 691: Speech of Mr. R. Franklin,
20 President and CEO of Ontario Hydro, June
21 13, 1990, entitled Integrated Long-Term
Planning and the Nuclear Option.

22 MR. HEINTZMAN: Q. Mr. Shalaby, are you
23 familiar with this speech of Mr. Franklin, President
24 and CEO of Ontario Hydro, on June 13th, 1990?

25 MR. SHALABY: A. I can't say I am

1 familiar with it, no. I have seen it. You handed it
2 to us yesterday.

3 Q. Yes. Let's turn to page 1.

4 A. I didn't read it all of it.

5 Q. This speech was given to explain
6 Ontario Hydro's commitment to the DSP process; right?
7 Mr. Shalaby, that's a fair statement of what this
8 speech --

9 A. I think it is given to American
10 Public Power Association and the title of the speech is
11 Integrated Long-Term Planning and the Nuclear Option.

12 Q. Yes. And in the third paragraph, Mr.
13 Franklin say:

14 I have been asked to discuss the
15 issue of long-term planning and the
16 absolutely crucial role it plays in our
17 business. More specifically, I have been
18 asked to speak to you today about Ontario
19 Hydro's recently published 25-year plan.

20 Utility planners have never faced more
21 obstacles in getting their plans on paper
22 and into practice. Increasing government
23 regulation, rising public concern for the
24 environment, scarce resources, global
25 competition and the rise of powerful and

1 influential special interest groups have
2 combined to make an already imprecise
3 science even more precarious.

4 Do you agree with that?

5 A. You are putting me in a tough
6 position of agreeing or disagreeing with the company
7 president, or a previous one.

8 I generally agree with it, yes.

9 Q. Ontario Hydro is proposing \$62
10 billion of electrical projects over a
11 25-year period. Many people in the
12 business are asking why. It is we are
13 planning to swim against the stream. We
14 think we have no choice but to plan a
15 full generation ahead.

16 And at the bottom of the page he says:
17 But forecasts however problematic are
18 unavoidable. For one thing, they are
19 critical because at Ontario the lead time
20 for getting a major more new base load
21 station designed, approved and built can
22 be as long as 14 years.

23 Do you agree with that statement?

24 A. That was the information in our
25 exhibits, consistent with it, yes.

1 Q. Yes. The next page:

2 To restrict ourselves to planning only
3 for the short term would be to deny
4 ourselves and our customers good,
5 environmentally sound, reliable, safe and
6 cost-effective options.

7 Do you agree with that statement?

8 A. Generally, yes.

9 Q. Dropping down one paragraph:

10 The bottom line for Ontario Hydro is
11 that despite the drawbacks, we felt we
12 couldn't afford not to make the
13 fundamental commitment to balanced,
14 long-term planning.

15 Do you agree with that?

16 A. Yes.

17 Q. The next paragraph:

18 In some ways our historical role as
19 Ontario's virtual sole supplier of
20 electricity and the pivotal role that
21 electricity has played in the development
22 of the province is unique. It certainly
23 makes possible a far longer term planning
24 horizon that might be possible for many
25 of you.

1 Referring to the Americans.

2 Do you agree with that?

3 MR. SNELSON: A. I think there might be
4 a little hyperbole there in suggesting that our
5 situation is unique.

6 Q. Well, leave out the uniqueness. Do
7 you agree with the statement about the role of Ontario
8 Hydro?

9 A. Generally, yes.

10 Q. Let's turn to the next page. Page 3,
11 fourth paragraph:

12 Sure there is a role for short-term
13 ingenuity and resourcefulness. I'm a
14 family man and I am not one to scoff at
15 the usefulness of Band-aids, but we also
16 have to have a vision and a plan for what
17 we want to bequeath our children.

18 Do you agree with that, Mr. Shalaby?

19 A. I think this comes to some of the
20 issues that I talked about in the rationale for the
21 approvals that we are seeking--

22 Q. It certainly does.

23 A. --in that the long-lived nature of
24 the transmission associated with the Manitoba Purchase
25 and with the hydraulic options is in a sense an

1 investment by this generation for the benefit of this
2 generation, but particularly for the benefit of future
3 generations.

4 Q. So I take it you agree with that
5 statement in that paragraph?

6 A. Generally, yes.

7 Q. And you do, Mr. Shalaby?

8 MR. SHALABY: A. I do.

9 Q. And he drops down one paragraph:

10 After all the issues, statistics and
11 scenarios had been evaluated, we were
12 left with one agonizing question. Would
13 the traditional, medium-term, step-
14 by-step planning approach we had used in
15 the past work once more? Or did the
16 times call for a more comprehensive and
17 inclusive planning strategy?

18 We opted for the latter. A strategy
19 where all demand and supply options would
20 be analyzed and debated, and a strategy
21 which invited the public to voice its
22 opinion as to what kind of a power system
23 it wanted.

24 Do you agree with that, Mr. Snelson?

25 MR. SNELSON: A. Yes, and that's

1 happened through the development of the demand/supply
2 planning strategy.

3 Q. Our objective was to achieve balance.

4 Do you agree with that, Mr. Snelson?

5 A. Yes.

6 Q. And then dropping down one further
7 paragraph:

8 We had to balance the short-term
9 against the long-term, and most
10 fundamentally we had to achieve balance
11 between supply and demand over time.

12 Do you agree with that?

13 A. Yes.

14 Q. Dropping down to the next page, page
15 4, the bottom of the page:

16 The balance in our 25-year plan gives
17 us flexibility to accommodate the
18 inevitable unforeseen situations. We
19 have to be able to meet higher than
20 expected demand or lower than expected
21 demand, to accept higher than anticipated
22 response to conservation initiatives or
23 from private suppliers. We have to be
24 able to accommodate delays in
25 construction whether caused by technical

1 or economic problems.

2 Do you agree with that?

3 A. Yes.

4 Q. On page 5, second paragraph:

5 This flexibility has a cost but we see
6 this as a necessary insurance premium.

7 Do you agree with that?

8 A. In principle, yes. We believe that
9 our current planning around the median approach
10 provides the right balance between the cost and
11 flexibility in our current circumstance.

12 Q. Well, Mr. Franklin in a portion of
13 his special, which thankfully you agreed with, on the
14 previous page it said:

15 We have to be able to meet higher than
16 expected demand.

17 You agreed with that when I read it to
18 you.

19 A. Yes.

20 Q. Dropping down to the bottom of page
21 5:

22 Although this can be time consuming
23 and burdensome - and he has referred to
24 all of the environmental hearings that
25 you have to go through in Ontario - it

1 should result in a stronger consensus and
2 a more reliable foundation for long-term
3 planning.

4 Do you agree with that?

5 A. That is one possible outcome of this
6 hearing. It would be a desirable outcome.

7 Q. It's one that you want. It's one
8 that Mr. Franklin wanted. Is it one you want?

9 A. Well, I think we have already
10 testified as to what we want from this hearing. We
11 want certain approvals and there may be other matters
12 that are discussed through that process, but primarily
13 our purpose is to obtain the approvals requested.

14 Q. Well, Mr. Franklin was speaking to
15 the DSP, the choices that were contained in the
16 original DSP; wasn't he?

17 A. Yes, he was.

18 Q. And he was asking for a debate and a
19 consensus on those choices; wasn't he?

20 A. He was asking for that, but you have
21 to put that in the context of the situation at the
22 time.

23 Q. He was asking for a debate and a
24 consensus on those approaches; wasn't he?

25 A. Yes.

1 Q. Page 6:

2 In the 25-year plan we have defined
3 our undertaking as a program to provide
4 electricity services. We have included
5 in the application a case for the need
6 for electricity and a menu of
7 alternatives for meeting that need. This
8 menu includes new nuclear and fossil
9 stations on a number of potential sites,
10 transmission capacity, private suppliers,
11 management or demand and purchases from
12 other Canadian utilities. We are asking
13 in phase 1 for the Board to consider the
14 broad plan and to accept our plan for
15 need and the technologies and the
16 methodologies for meeting that need.
17 Dropping down further:

18 This first phase hearing process will
19 provide a context with a legal
20 underpinning for the environmental
21 discussion of the individual projects to
22 be heard in Phase 2.

23 That was the purpose of the DSP.

24 A. Well, I would use as the purpose of
25 the DSP the precise definition of the -- that is given

1 in Chapter 19 of Exhibit 3, and in the update document,
2 Exhibit 422.

3 What gets written in speeches tends to be
4 a little liberal interpretation of precise sets of
5 words.

6 Q. Well, Mr. Franklin wasn't just
7 referring to Chapter 19, he was referring to the whole
8 DSP.

9 A. But Chapter 19 of the DSP refers to
10 what is our definition of the undertaking and what
11 approvals that we were requesting at that time.

12 Q. Yes, but you can't have a debate
13 unless you have got the elements on the table; can you?

14 A. That is correct.

15 Q. And you can't have the debate unless
16 you have got chapters 1 to 18 to tell what you chapter
17 19 means; can you?

18 A. That is correct.

19 Q. Further down page 6:

20 We could have gone to the Board on a
21 case-by-case basis as we needed more
22 generation. If we had done this, then
23 every time Hydro made an application for
24 new generation we would have to discuss
25 the alternatives, load forecast and

1 generic affects for the generation
2 request, as well as the site-specific
3 components of the project. We would have
4 to reinvent the wheel with each
5 application. This approach would be
6 extremely time consuming. It would
7 probably result in the most difficult
8 decisions constantly being put off until
9 later.

10 Would you agree with that, Mr. Snelson?

11 A. Certainly one of the reasons for
12 bringing all of the approvals together in the 1989
13 Demand/Supply Plan, all the approvals of rationale and
14 need, was to avoid the duplication of debating all the
15 need issues in each individual application, and also of
16 the possibility of conflicting decisions with respect
17 to individual applications.

18 Q. Do you agree with the statement that
19 I just read from Mr. Franklin's speech? Do you want me
20 to read it again?

21 A. Generally I agree with it, yes.

22 Q. Thank you.

23 [4:50 p.m.]

24 Just before the last page, page 8, at the
25 bottom of page 8:

1 Our size also allows us to consider a
2 blend of small and large stations. At
3 the same time, if demand does not follow
4 the predictions we can alter schedules on
5 the smaller units as necessary without
6 incurring the extremely high costs of
7 altering the schedules of a nuclear
8 station.

9 Do you agree with that statement?

10 A. The 1989 Demand/Supply Plan did move
11 around the in-service dates of the combustion turbine
12 units, and so on, and had less movement in the nuclear
13 stations, and to that extent I agree with it.

14 Q. Yes. And he is suggesting that that
15 is a desirable thing, that you can leave the larger
16 nuclear stations with their planned in-date service and
17 move the smaller components as and when necessary, as
18 you have pointed out in Plan 15 from time to time?

19 A. I wouldn't call that a desirable
20 feature. I would call that a response to the
21 difficulty in moving around the in-service dates of
22 nuclear units, and rather than actually move the
23 in-service dates of the nuclear units themselves it is
24 preferable from a planning perspective sometimes to be
25 moving around the in-service dates of other components.

1 But that is more a response to the
2 inflexibility of the nuclear units than it is by itself
3 a desirable feature.

4 Q. But the integrated plan allows you to
5 do that?

6 A. An integrated plan allows you to do
7 that.

8 Q. And finally, on page 9 I guess Mr.
9 Franklin can foresee the future:

10 Ontario Hydro obviously has set itself
11 a mammoth task in proposing a 25-year
12 plan with a large nuclear component. It
13 would be foolish for me to suggest that
14 everything will go according to that plan
15 or there will be anything other than a
16 tortuous or difficult process.

17 I guess Mr. Franklin was right on that, wasn't he.

18 A. I certainly have spent a lot of time
19 here, and it seemed rather tortuous and difficult at
20 times.

21 Q. Now, let's turn from analyzing the
22 various plans to looking at your upper case, and that
23 is to be found in Exhibit 646, as I understand it,
24 attachment D.

25 I am going to be spending a few minutes

1 on this, Mr. Chairman. Would you prefer to stop now, I
2 am entirely in your hands.

3 THE CHAIRMAN: I think it might be a good
4 idea to stop now, Mr. Rodger has something he wants to
5 say. Well, just a moment, Mr. Rodger. We will start
6 again on Monday morning and continue this. Mr. Rodger?

7 MR. RODGER: Mr. Chairman, I have spoken
8 with counsel for the Canadian Nuclear Association and
9 he asked me to inform the Board that the Canadian
10 Nuclear Association will be relying on the cross-
11 examinations of AMPCO and the MEA and will have no
12 questions for this panel.

13 THE CHAIRMAN: Thank you, Mr. Rodger. I
14 don't know, Mr. Heintzman, whether you should be
15 offended by that or not, but... [Laughter]

16 MR. HEINTZMAN: Ms. Findlay says, "He
17 hasn't read the transcripts yet."

18 THE CHAIRMAN: We will adjourn until
19 Monday morning at ten o'clock.

20 THE REGISTRAR: Please come to order.
21 This hearing will adjourn until ten o'clock Monday
22 morning next.

23 ---Whereupon the hearing was adjourned at 4:55 p.m.
24 to be reconvened on Monday, June 1st, 1992, at 10:00
a.m.
